road. An idle navvy, therefore, is sometimes better off than a working navvy, because the former can collect six or seven shillings, or more, in the course of a day. Similarly, it is the rule in many trades to present so much to every 'traveller' who calls at a 'shop' or works, or to allow him to make a collection among the men.

Scores of lazy vagabonds—fellows who never had, and never will have, regular employment—take advantage of this admirable custom. Professing a dozen trades in a day, they 'call' them all, telling a different story on each occasion, though really no story is necessary. All that a man need do is to inquire for the 'father of the chapel,' 'the shop steward,' 'the leading hand,' 'the foreman,' or 'the overseer;' everything depends on his asking for the right person and using the phrase customary in the trade he is 'calling.' Sometimes, but not often, a question is put to the traveller. 'What is that?' a baker may say, pointing to his 'peel;' a tailor may see if the man knows the technical terms for a particular kind of work; a printer may pick up a stray 'quad' and ask to be told its size. Any error in replying is fatal; indeed, it has resulted in the applicant being kicked outside. Society men, however, rarely practise this form of swindling; and in calling their own trade they can prove the genuineness of their case by producing their travelling card.

Trades-unionists, when hard pressed, as they frequently are in passing through agricultural districts, are also obliged to sing at public-houses—a mode of 'raising the wind' familiarly known as 'working the pubs'—beg, sleep in casual wards, and avail themselves of charities. All who are in the south of England make a point of seeing at least Watts's Charity, at Rochester, celebrated by Dickens in 'Seven Poor Travellers.' So many wend their way thither, in fact, that the inhabitants of the town look upon the institution as a nuisance; and it is said that some years ago an effort was made to close it, and divert the money left by the founder to other charitable purposes. Almost any evening an odd-looking crowd of 'tradesmen' may be seen outside the unique institution, each man waiting to lay his claim before the Committee to be one of the 'seven travellers' who, by the terms of Watts's bequest, are to be boarded and lodged every night. Admission to the charity is worth trying for; it is a perfect paradise for tramps.

Yet, in spite of insult, hunger, and fatigue, travelling tradesmen, especially those who are unmarried, soon grow to like the life of the roads. 'A wanderer is man from his birth;' and when the natural instinct is revived, many individuals are loth to settle down to regular employment. The great army of habitual tramps is largely recruited from men who start from home with the intention of walking a particular number of miles in the hope that 'something will turn up.' Trades-unions are quite sensible of this and of other evils of the travelling system. The avowed object with which the 'Out-of-work Fund' of the Typographical Association was established in 1873 was to keep men 'off the road;' and the mileage relief of the Amalgamated Society of Painters and Decorators was abolished because it was so grossly abused. But these things are

perhaps inevitable, and certainly they do not detract seriously from the praise due to traders-unions for the assistance they render to those obliged to tramp in search of work.

PHYLLIS MARSDEN'S LOVE-POEM.

CHAPTER II.

It was a sad sight! Dickie had built a beautiful temple. Judging from the ruins, as well as from his broken and tearful explanation, it must have been a singularly fine example of its class. When it was completed, however, Dickie, surveying it with a too critical eye, judged that it wanted colour; and seeing on a bracket not far above his head a valuable little china teapot, of a beautiful blue, he had climbed on a chair, possessed himself of the coveted ornament, and, amid breathless suspense, set it on the cupola of his temple. In that position, any one would have admired it—if only it would have stood erect. It was made with a stupid round bottom, and Dickie's temple had a cupola! It rolled off; it was most mortifying! Not only did the ornament tumble down and break itself too much to be replaced, but, what was worse still, the temple itself, the finest Dickie had ever built, was shaken down in ruins. It was too much to bear! Dickie wept aloud.

At that moment, the door opened suddenly, and a little lady ran in suddenly. 'What, in the name of fortune, is all this noise?' she cried.—'Phyllis, why didn't they tell me you were here?—Harry, what mischief is this? What have they broken? Not my teapot!—Harry, I'll never forgive you!'

Captain Benson retreated to the fireplace, and stood with his hands in his pockets, and a half-smile on his face, watching his sister, while she took up one piece after another of the shattered porcelain. She looked unutterable things at her brother; but Phyllis came forward and touched her arm timidly. 'Do you mind *very* much, Kitty?' she said. 'I am so sorry.'

'My dear Miss Marsden,' interposed Captain Benson, 'this grief is all put on. The teapot had no value. I saw its exact duplicate at Whiteley's on Wednesday, marked tenpence three-farthings.'

'Did you really, Harry?' asked his sister. 'No; but tell me—because Mary Haughton gave me that teapot, and I always suspected she paid very little for it.'

'I shall tell you nothing more,' said Captain Benson. 'I have said too much already. I shall certainly not put into your hands any engine for destroying Mary Haughton's peace of mind.'

Mrs Huxtable drew over to the fire, and settling herself comfortably, said: 'Now, Phyllis, tell us what you have been doing.'

'Well,' said Phyllis demurely, 'I spent this morning or part of it in reading Persian love-poems.'

'Reading what?' exclaimed Mrs Huxtable, sitting bolt upright with a face of amazement.

'It is quite true,' Phyllis nodded. 'At least, they were read to me.'

'And what were they like, these love-poems? Something your father is doing, I suppose.'

'They were not very interesting,' Phyllis ad-

mitted; 'but curious—decidedly curious. They were inflated and roundabout, and there was a great deal about the moon and roses, and the night and towers.'

'I see,' Captain Benson assented. 'All topics which have no business to be in a love-poem, which should be terse'—He paused.

Phyllis nodded.

'Direct in expression.'

'Of course.'

'Not too long.'

'Certainly not,' said Phyllis with decision, 'or one would be horribly bored.'

'I think you are very dull, you two,' said Mrs Huxtable, stifling a yawn. 'Can't you talk of something more interesting?'

'Forgive us, Kitty,' said her brother. 'Of course, your interest in such things ended when you married.'

Captain Benson went off to have a cigar; half an hour later, he returned with a sheet of paper in his hand. 'Why, where is Miss Marsden?' he asked.

'Half-way home, I should think. What do you want her for?'

'I had something to show her. Never mind; I will send it to her.'

Next morning dawned brightly, and Phyllis, as she donned her dainty garments, was half inclined to regret her hasty promise of the previous day, knowing full well that if her father's approval was to be gained, at least some hours must be devoted to copying the manuscripts.

Running lightly down-stairs, she paused to gather up a letter which lay on the hall table. 'Only one! When I expected at least half-a-dozen, and it looks like a stupid one. I don't know the writing.' Tearing the envelope, she entered the dining room, but stopped abruptly: 'DEAR MISS MARSDEN—Apropos of the love-poems we were discussing yesterday'—Phyllis hastily turned the sheet and read the bold signature, 'H. BENSON.' Flushing slightly, she put the letter in her pocket, as her father's step was heard in the hall. Why should Captain Benson write to her? It was a woman's question, and though little more than a girl, she had become a woman all at once after meeting Mr Benson at Dunveith. Her father did not note the difference, and she did not quite comprehend it herself. But difference in Phyllis there was.

She bade her father good-morning, but Mr Marsden took no notice of her remark, only seated himself at the head of the breakfast table; while Phyllis, surprised at the unmistakable gloom on his face, sheltered herself behind the coffee-pot.

Mr Marsden raised his eyes absently, then seeing his daughter's anxious face, remarked: 'I am perplexed, Phyllis. I have come to a line in the finest of my poems—the one I read, or'—pausing as he remembered the incident—'began reading to you yesterday, and I fail to find any word which expresses the sublime meaning of the original.'

Seeing that her father really was distressed, Phyllis rose, and putting her arm round his neck, said lovingly: 'Never mind; the right word will come; and in the meantime do start me copying; and when you see how beautiful your poems

look, you will be inspired, with fresh terms of admiration.'

Half an hour later, Phyllis in her own room was seated at her pretty writing-table, a large sheet of foolscap before her, a pile of untidy scraps of paper by her side, and a letter stuck up on the writing-table before her.

'My beloved is fairer than the white rose of morning,' wrote Phyllis. But her eyes turned again to the love-poem in that letter signed H. Benson.

'I sleep to dream of thee,' it said.

'I wake to live for thee,' it continued.

'And this is all for thee!' was the conclusion. This love-poem was certainly not too long.

'Must I answer it, I wonder? The lines really are direct, short, and to the point—out of his mother's old album, too! However, I can't write now, if at all;' and Phyllis determinedly placed the letter face downwards on the table, and for some time wrote most perseveringly.

The work proved far more interesting than she had expected. The quaint metaphor, exaggeration of language, and, to English minds, strange jumble of ideas, amused her; and she was surprised to find she had been writing steadily for an hour when she heard her father's voice calling her, 'Phyllis, Phyllis!' irritably.

'Coming, papa! Just coming!—Yes; what is it?' and Phyllis, peering over the banisters, saw her father impatiently pacing the hall below.

'Come here, Phyllis! You have taken all the notes of the poem I am engaged on now. They were all together on the right-hand side of my table, and I can find them nowhere. If you really wish to help me, you ought to be more careful.'

'I am sorry, papa. You can keep them till to-morrow. I wish I hadn't mixed them up. And here are the four I have copied. They really do look better now, don't they? And I found them interesting! Indeed, I did!'

Mr Marsden took the papers and manuscript, only half mollified; and Phyllis heard the key turn as he closed his study door. She looked back a little wistfully.

As she prepared to go out she could not help thinking of that love-poem from Captain Benson, and why he had sent it to her, and why her father should dislike him so, and why, since she knew him, something had entered into her life and made it all strange and new, with only her father's hatred of Mr Benson to darken the vision.

Notwithstanding this slight shadow, few brighter faces than Phyllis Marsden's could be seen as she sped gaily on her walk round Kennington Park. The sun shone brightly, and the air was crisp and clear, with a first feeling of frost. Phyllis felt exhilarated; and being breathless with her walk, and tempted by the sunshin, made for a seat at a convenient distance, and sat down to rest for a moment.

'I wake to live for thee!' sang a robin perched on a small bush near at hand, a cheery little fellow, who looked at Phyllis with a knowing look on his face.

'What ought I to do?' thought Phyllis. 'Why do I keep thinking of those lines, and why did Captain Benson send them to me? I wish I knew more about these things, or had some one to ask'—And Phyllis, looking cau-

tiously round, put her hand in her pocket and pulled out—nothing.

'It must be here! I know I had it in my pocket. Stay. Did I change my dress? No: then where is it?' And Phyllis in her impatience turned her pocket inside out; but there was nothing save a dainty embroidered handkerchief.

'Oh, I know! I must have left it on my writing-table. I had it there, of course!' And Phyllis, with a relieved expression, turned to retrace her steps.

The lunch gong sounded as she ran up the steps; and she was met by Robins. 'The master wished me to say he did not want to be disturbed; and I have taken him lunch in a tray.'

Phyllis's face fell as she replied: 'Very well, Robins. I shall be down directly.'

Up-stairs, Phyllis stood before her glass, smoothing her hair, a flush of annoyance on her pretty face, and tears of vexation in her eyes. 'It is too hard! I felt certain I should find it on my writing-table. There is no doubt I must have gathered it up with papa's papers, and now he has got it; and he is sure to read it, for I had carefully folded it with the verses outside, and he wouldn't see it with a letter at first. Oh! I do hope he won't see it before I can get it back. For he so dislikes Captain Benson, without having even seen him.'

Down-stairs, a bent and prematurely old man leaned on a paper-strewn writing-table, an open letter in his hand, an expression of mingled love, pity, and distress softening his hard, careworn features.

'Phyllis, my child, my little girl!' he murmured. 'She has grown into a woman, and I have been blind to it.' And then seating himself in his chair, and passing his hand wearily over his eyes, he thought of another Phyllis who had been his wife and his little girl's mother.

The afternoon passed wearily away, and Phyllis restlessly paced backwards and forwards in her large drawing-room, now striking a few chords on the grand piano, now picking up a delicate piece of fancy-work, or scanning the pages of a novel. 'I can't help it! I shall settle to nothing until I know. I shall go and hunt up papa; and if he is angry, it will be over. I have done nothing wrong, and I certainly couldn't help getting that letter. If he has not found it, I may have an opportunity of getting it back; and then we'll see what will become of Captain Benson's love-poem. "Live for thee!" Fiddlestick! Why, that person must have been lived for, ages ago, and died for too, for the matter of that. Tiresome creature! Why couldn't she keep her love affairs to herself, instead of letting them get me into trouble!'

Drearly, Mr Marsden sat over his study fire, the tray of luncheon untouched beside him. For three hours he had been sorrowfully living over his past life. Visions of the past flitted through his mind. A young student, fresh with university honours, and craving for literary distinction—months of study and Oriental travel; and then a period of purest happiness, no longer alone, but cheered and encouraged by a bright, loving presence; and then—then a long period of black, deepest despair; a life taken up again, but hence-

forth never to be shared with living soul—alone, yet not alone—a tiny, toddling babe, the merriest creature imaginable, who absolutely declined to be suppressed, crept into his life; a little being who would not be ignored; who expected to be welcomed on every occasion; who lisped ‘Daddy, daddy!’ as she patted the knee, and glanced up into the face of the grave, preoccupied man who lived the life of a recluse.

And now Phyllis—Phyllis, the living image of that other Phyllis, his wife; and Mr Marsden paused as he thought of what the long weary years would have been, uncheered by the merry prattle and loving ways of his child, his little one!

‘I don’t think it can be too late! She has only known him a few months. I must see what can be done; and find out something more about this “Yours very faithfully, H. Benson.”’

A low tap and timid voice. ‘Papa! do let me come in; it is tea-time;’ and with this the door opened, and Phyllis, nervous and excited, entered the study. Something in her father’s manner struck her at once with a feeling of alarm. ‘Papa, what is it? Are you ill? Why, how cold you are! And your luncheon never touched! Why, you must be starved!’ Phyllis laid her hand on her father’s and looked up in his face.

‘Not cold, exactly,’ he replied, ‘nor even hungry. But I came to a standstill in my work, and have been sitting here feeling a good deal upset ever since.’

Phyllis rang the bell, and set herself to work to stir up the last embers of the fire.

‘Bring tea in here as soon as possible, Robins!’ And Phyllis drew her stool to her father’s knee, and began chafing the almost numb fingers. ‘Papa, I shall confiscate all your work, if you behave so! The poems really are not worth it;’ and Phyllis glanced at the writing-table. ‘However, here is tea, and that will put some warmth into you.’

Phyllis rose; and in a short time Mr Marsden, once more warm and comfortable, lay back in his chair, listening to his daughter’s chatter, and ever and again passing his hand over the soft silky head. The caress was so unusual that Phyllis felt more uneasy still.

‘I hope papa is not going to be really ill,’ she pondered, ‘or have one of those awful fits of depression. I thought he had quite got over them.’

Then, with a glance at her father’s worn features, she went on to herself: ‘This makes it even more unfortunate about that letter. I must get it back.’ She half rose, looking wistfully at the writing-table.

The movement roused Mr Marsden. ‘Where are you going, Phyllis?’

‘Nowhere, papa. I was only going to draw the curtains and tidy up your table a bit.’

‘Sit still, child: I want you to write a note for me. I have been thinking perhaps I am foolish in my prejudice against Captain Benson, and ought to take advantage of his being in town to discuss some of the difficult points of my work with him. He has the reputation of being a clever man. I confess I consider it would have been better taste if he had called on me. But I suppose that would have been too much to expect.’

‘Papa, that is not just, really. It is my fault he has never come. He said several times in the summer he should take an early opportunity of calling on you; and I always put him off, and said you never saw any one. I thought he would only bore you.’

‘Bore me, Phyllis! Does he bore you?’

‘Me, papa!’ with wide open eyes. ‘Oh, no! not a scrap. But then it is different with me.’ And Phyllis smiled, as she thought of the many picnics and tennis parties of that never-to-be-forgotten visit. ‘Now let me write the note. What day shall I say? May I write at your table?’

‘You had better ask him to dinner on Thursday; and you must ask Mr and Mrs Huxtable, too, since he is staying with them.—No; I shall be using my table. I have a few letters I must write before dinner; and I have no small note-paper here, either.’

Phyllis felt the fates were against her; but she would make one more effort. ‘Very well; and I may as well take your notes and do some more copying after dinner. I have nothing else to do.’

‘The poems must wait till after I have seen Captain Benson,’ replied Mr Marsden. ‘They ought to be arranged carefully, according to the different periods; and that is one of the points on which I want another opinion.’

Phyllis saw that it would be useless to attempt regaining her letter that evening. Mr Marsden looked wistfully after the slight figure as she left the room. ‘Shall I call her back, and tell her what I know? Even now I might gain her confidence!’ Mr Marsden half rose from his chair; then the habit of years of reticence overcame him, and he re-seated himself.

Outside, Phyllis paused an instant with her hand on the door handle. ‘Shall I go back now, and tell papa everything? If only he were always as he has been this evening, I should never mind telling him anything. But he will be dreadfully annoyed; and he does not seem well to-night.’

So Phyllis took her candle and went up to her room.

FORTUNES IN VOICES.

THE Philosopher’s Stone—that dream of the old alchemists—takes many forms nowadays, but none more beautiful than that of the voice of a great singer—a truly potent spell to open the gold mines of earth! The amounts that have been paid to the famous sopranos, tenors, contraltos, and basses who have appeared from time to time above the musical horizon sound well-nigh fabulous, and are not a little interesting to consider. To go back to the early years of the last century, and to the early days of the Italian opera in this country, Mrs Catherine Tofts, its first lady-interpreter in England, claimed high salaries at the theatre in Lincoln’s Inn Fields. She drew considerably over six hundred pounds for a season; and at one time she was singing for twenty guineas a night—high terms in 1708. At the same theatre, twenty-six years later, the great singer, Farinelli, during the three years he spent in London, though his salary was but

fifteen hundred pounds a season, earned at least five thousand pounds yearly; for at but one of his numerous appearances at court, the Prince of Wales gave him 'a fine wrought gold snuff-box, richly set with diamonds and rubies, in which was enclosed a pair of diamond knee-buckles, as also a purse of one hundred guineas.' Later in life he accepted an engagement at the court of Spain at a salary of fifty thousand francs (about £1979) per annum.

Two years after Farinelli had left London, the other great singer of the time, Caffarelli, appeared at the King's Theatre, but did not fulfil the expectations he had raised, though at Venice he received £385 and a benefit of £335 for a season of three months—higher terms than had previously been paid to any singer.

In 1768, Gabrielli, one of the most beautiful of women and magnificent of sopranos, demanded five thousand ducats salary from Catharine II. of Russia. The Empress objected that it was larger than the pay of a field-marshal. 'Then let your field-marshal sing for you,' retorted Gabrielli, as Caffarelli had replied before under like circumstances.

That phenomenal soprano, Agujari, was in 1775 paid one hundred pounds a night for two songs at the London Pantheon concerts—an immense salary in those days. About thirty years later, Catalani was receiving three thousand pounds for the season in Portugal; and in 1806 she came to London for a promise of two thousand pounds for the season from September 15th to August 1807, with a further sum of one hundred pounds to defray the cost of her journey to London, and one benefit night free of expense. As a fact, however, she drew from the King's Theatre in the Haymarket five thousand pounds, including benefits; and her total profits in 1807, with concerts and provincial tours, were £16,700. She once received two hundred guineas for singing 'God save the King' and 'Rule Britannia'; and for her services at one festival she was paid two thousand pounds. Her charities, however, were innumerable; and it is estimated that she earned at least two million francs at concerts for such purposes alone. As an instance of her reckless extravagance, it is stated that the cost of beer for her servants for a single year amounted to one hundred and three pounds.

The next singer, taken in chronological order, whose salary was unusually large was Pasta, who, having sung at the King's Theatre in 1816 with her husband at a joint salary of four hundred pounds for the season, was engaged alone in 1826 at £2200—an amount which was increased the following year to £2365. In 1840, after a long retirement from the stage, she accepted two hundred thousand francs to sing again at St Petersburg, though, for her reputation as a singer, it had been better had she refused.

In 1828 Lablache drew sixteen hundred pounds, with lodging and a benefit night free of expense, for a season of four months. This was, however, not nearly his value in an operatic company.

At the King's Theatre, in 1825, Malibran made her début, and was immediately engaged for the remaining six weeks of the season at five hundred pounds. In 1830 she was paid in Paris 1075 francs for each operatic representation, though a year before she had received sixty-six pounds

from Laporte in London for each performance. For each private concert in London she was paid twenty-five guineas; and she was engaged by Mr Alfred Bunn for nineteen nights at one hundred and twenty-five pounds per night, payable in advance! Singing at Drury Lane in English opera in 1833, she received eighty thousand francs (£3200) for forty representations, with two benefits, which produced not less than fifty thousand francs (two thousand pounds). Two years later, at the opera in London she drew £2775 for twenty-four appearances. Such sums were paid to her at the English provincial festivals as had never before been heard of; and at La Scala she received nearly eighteen thousand pounds for one hundred and eighty-five performances.

In 1838 Mario was offered sixty pounds a month for his first appearance, though this was of course largely the result of his romantic history. Alboni's salary at Covent Garden in 1847 was raised from five hundred pounds to two thousand pounds the day after her first appearance, singing as she was against Jenny Lind at the opposition house. Sontag was paid six thousand pounds for a season of six months at Her Majesty's Theatre in 1849.

Rubini, who began his career at thirteen years of age by singing, for five francs, an air in a new drama by Lamberti, made immense sums in later life, realising two thousand pounds at one concert in St Petersburg. Unlike Mario and Mara, who both died in comparative poverty, Rubini saved large sums, and left behind him one of the largest fortunes ever amassed on the operatic stage.

Jenny Lind was naturally paid enormous sums in the course of her triumphant career. During a tour of two years through the States, commenced in 1850, she made twenty thousand pounds, gaining a husband as well!

These pecuniary traditions are adequately preserved by at least two present-day singers, to whom a hundred or two for a concert is an ordinary sum—Madame Patti and Madame Albani. It is current knowledge that the usual terms of the former are eight hundred pounds per concert in London, and four hundred pounds in the provinces; and it was announced the other day that for a prospective tour in the States, during which she is to give about forty-five performances—some at the Chicago Exhibition—she will receive £40,500, or nine hundred pounds per concert, plus all travelling expenses. Madame Patti lately refused an offer of a tour in Brazil at the remuneration of twelve hundred pounds a night.

Fairly handsome salaries are paid also to leading artists of the Vienna opera. The florin is just now worth about one shilling and three-pence, and Herr Winkelmann, a tenor who appeared in London in German opera some years ago, is paid twenty-six thousand florins (£1625) for a season of nine months. M. Van Dyke gets about twenty-four thousand florins; but he sings only seven months of the year in Austria. Frau Materna, who is soon to retire, to be replaced by Frau Klafsky, gets the same amount for the whole year; and Frau Schlüger, the dramatic soprano, receives twenty thousand florins per annum. The tenors thus get more than the sopranos.

Before leaving the subject of singers salaries,

it were curious to mention the remuneration received some years ago by Mademoiselle Zélie, of the Théâtre Lyrique at Paris, while singing at a concert in the Society Islands, in the course of a tour round the world. She was to sing an air from 'Norma,' and a few other songs, and bargained for a third of the receipts. She found that her share consisted of three pigs, twenty-three turkeys, forty-four chickens, five thousand cocoa-nuts, and a considerable quantity of bananas, lemons, and oranges!

MRS MELROSE'S COMPANION.

By RICHARD WARFIELD.

'ABSURD!' cried Mrs Melrose scornfully; 'you must be dreaming, I think, Maria, or you would never propose such a piece of foolery. Why, that little chit is forty years younger than he is, at least.' And the angry widow tossed her head disdainfully, as if to imply she had never heard such ridiculous folly before.

Maria remained silent, knowing, probably from long experience of her friend's petty outbursts of temper, that silence was the only safe course to adopt. Her poor little heart was beating rapidly: she so much dreaded offending her benefactress, who really was a most kind-hearted, agreeable sort of person in a general way, and not much given—that is, as the world goes nowadays—to ebullitions of anger against her paid dependent.

On the afternoon, too, of which I write Maria had been particularly indiscreet—had shown an alarming want of tact, which in Mrs Melrose's eyes was scarcely forgivable. For poor Maria had actually suggested that an oldish gentleman, a well-to-do widower for whom Mrs Melrose had been fruitlessly angling for a long time, had appeared to be greatly enamoured of a certain young lady—a mere chit, as Mrs Melrose designated her, scarcely out of the schoolroom.

She was a tall, stout, well-made woman, this Mrs Melrose, a woman of distressingly doubtful age, just the wife for an affluent widower with no encumbrances; and as she sat with knitted brow reflecting on what Maria had been telling her, she fully resolved to make one last desperate effort to catch the widower, Mr Heavysides, who was now over sixty.

'Maria,' she began in a stony manner, shaking her head till every false curl rustled lustily, 'pray, let me never again hear you give speech to so improper and immoral an opinion. I am deeply distressed when I reflect that you, who for years have lived under my roof and had the priceless advantage of my almost daily companionship, have made no better use of your time than to form fatuous and wicked conjectures about your neighbours.'

'I only repeated what every one is saying,' Maria remarked, meekly.

'Don't interrupt me, please,' replied Mrs Melrose in her most majestic tones; 'nor do I ever desire to know what every one is saying.'

You must be aware by this time, Maria, that village gossip and tittle-tattle have no interest for me. I hope I am above listening to petty slanders and jealousies. You may be quite sure that if Mr Heavysides *does* see fit to marry again, he will choose a woman of suitable years and deportment.'

'Yea,' said Maria, feeling something was expected of her.

'As it happens,' continued Mrs Melrose, 'I had intended calling on Mr Heavysides this very afternoon—I hear his gout is worse again—and as matters now stand I shall feel it incumbent upon me to tell him of the scandalous reports in circulation respecting him. Though the affair is of a delicate nature, I, as a friend of long standing, may, I think, without detriment to my self-respect, make him acquainted with all you have told me. I am sure he will be greatly grieved.'

'Please don't give him reason to suppose I told you, Mrs Melrose.'

'I shall use my own judgment, Maria, and act as I deem best.' So saying, the lady rose, and left the room with a grand sweep of silk and lace.

Outside the door, however, her whole demeanour changed, and running up-stairs as quickly as her years and weight would allow, she was soon engaged in getting herself up to the best advantage. And when she had finished, she might, with her rouged face, false teeth, and yellow curls, have really been taken for what she was fifteen years before.

Poor Maria, in anything but an er-ri-able state of mind, watched her patroness leave the house. Tears coursed down her pale, tired-looking face. 'Oh dear! oh dear!' she exclaimed, 'what shall I do? He is the only one who has ever spoken a kind word to me during the weary years I have been here. And now she is bent on setting him against me; I know she is. But it serves me right; I have only my own folly to thank.'

Meanwhile, the widow, conscious of her unimpeachable appearance, walked through the village, bestowing bows and nods in every direction. She was highly pleased with herself, and consequently felt amiable towards all mankind—except Maria. The village of Wychford stood a few miles away from a large manufacturing town, and several families of pretty good social status lived in it, the male members of which went daily by train to their business, returning home in time for a seven-o'clock dinner. Mrs Melrose was rather a favourite among these people—partly because she was excellent company, partly because they derived a great amount of amusement from watching her airs and graces.

'I ought to have been born a duchess,' she said, plaintively, on one occasion, with a naïveté which was positively ludicrous, 'I feel myself so suited for the rôle.'

Once seated in Mr Heavysides' parlour, and having inquired tenderly after the old gentleman's

health, Mrs Melrose gingerly approached the subject uppermost in her mind.

'I should think you must find it very lonely here in the house all day without a soul to speak to!' she began.

'I have a housekeeper, madam,' Mr Heavysides returned.

'Oh yes—Mrs Perkins, of course; but she is an ignorant, uneducated woman. What I meant was that you have no congenial companion with whom you can interchange ideas.'

'Mrs Perkins has an uncommonly educated idea of cookery,' replied the invalid; 'so we have a mutual ground of sympathy there.'

'What a tiresome man!' thought the widow. —'I must try another tack.'

The truth was Mr Heavysides had long ago discovered the lady's anxiety to share the joys and sorrows of his home, and, recognising in her a dangerous matrimonial campaigner, was always more or less on his guard when in her presence, momentarily watching for some token that she was about to recommence her amorous siege; and when she opened fire by commiserating his loneliness, he was instantly on the alert.

'Oh, by the way,' she pursued, playfully tapping him on the arm in a would-be reproachful manner, 'I have heard such a shocking, shocking story about you this afternoon. Surely, it cannot be true?'

'I cannot say, madam, until I know what it is.'

'Well—now you must not be cross with me, for I assure you it is the talk of the whole place, though it is too ridiculous for anything—it is said, and openly, that you are going to marry that minx of a Milly Dale. Did you ever hear the like?'

'It is very foolish talk,' assented Mr Heavysides.

'Just what I said,' chimed in Mrs Melrose eagerly. 'Of course, I gave the report a flat contradiction. "I am sure that Mr Heavysides would have told an old friend like me if there were any truth in the rumour," I said. "Rely upon it, it's nothing but a canard."'

'I thank you, madam—I thank you from my heart,' cried Mr Heavysides fervently, a merry twinkle in his eye. 'No,' he continued, 'if ever I do see fit to change my present lonely state—and I will not say that I shall not—I shall marry no bit of a girl, but some good, worthy woman of an age suitable to my declining years. For you are right, my dear friend; mine is a lonely life, and I often think a wife would be a source of comfort and solace to me.' And the old gentleman clasped the widow's fat hand in his.

'I am sure she would,' murmured the lady, actually blushing beneath her rouge.

'I am not poor,' went on Mr Heavysides—'far from it—and I have neither kith nor kin to whom to leave my money. Therefore, my widow, supposing I were the first to be taken, would inherit all I possess.'

'Dear man!' cooed the enraptured Mrs Melrose, 'how good you are!' for she no longer doubted that victory was hers.

'And may I—dare I tell you a secret?—Yes! Very well. I have already chosen a lady'—giving the plump fingers a hearty squeeze—'to whom to offer my heart and hand. Do you think she will accept them?'

'I am sure she will,' cried the now secretly exulting woman. 'Who could refuse any request of yours?'

Pen cannot describe the state of elation in which Mrs Melrose proceeded homewards. Her face was literally wreathed in smiles, and she held her head quite two inches higher as she walked along the street. Maria, who was seated at the parlour window, darning a table-cloth, happening to glance up as Mrs Melrose came along the garden path, was struck with amazement by the amiable expression on that lady's countenance. 'What can have occurred? She's in high good humour about something,' mused the companion.

'Marie, my dear,' exclaimed Mrs Melrose, as she burst into the room, 'I'm afraid I was rather cross with you before I went out; but I did not mean it, child. There! let me give you a kiss. I know you are a dear, good, faithful creature, though a little trying sometimes.'

Marie! Child! Only on very rare occasions did Mrs Melrose use these pet names when addressing her companion.

'Have you seen Mr Heavysides?' inquired Maria timidly.

'Dear me! yes,' Mrs Melrose cried; 'and such news as he told me! You'd never guess it if you tried for a month.'

'That he's engaged to Milly Dale?'

'You'll make me quite angry again, Maria, if you will persist in such obstinate ideas! Mr Heavysides disclaimed all intention of making so preposterous a union. But,' and the widow gave a meaning smile, 'he is going to marry a second time, and the name of the lady is well known to you, Maria.' So saying, Mrs Melrose quitted the room and went up-stairs to take off her outdoor garments.

Meanwhile, Mr Heavysides had been engaged in a manner which, to say the least, was very extraordinary. No sooner had he heard the house door close behind his guest, than he lay back in his chair and gave vent to a series of spasmodic chuckles. 'I'll do it,' he gasped—'I'll do it. What fun it will be! And she really is a very nice little thing, and would make an excellent wife. She has not a very gaudy time of it with the old woman, I'll be bound. How mad she'll be. She thinks I mean business, and so I do; but not with her!' and the old fellow spluttered and grimaced till he nearly choked himself with merriment.

'Maria,' said Mrs Melrose about eleven o'clock the next morning, 'can you see who that is just opening our gate? I do not recognise the lady.'

'It's Mrs Perkins, Mr Heavysides' housekeeper,' answered Maria.

The widow bridled and smiled meaningly. 'Ah! yes, to be sure! I'd forgotten; but he did say something about sending here this morning, though what about I do not remember.—Just run to the door, Marie dear, and see what Mrs Perkins wants.'

'Good-morning, Miss Stonor,' began the house-keeper, in a purposely loud voice. 'I hope I see you well, miss? Master's sent these here grapes for Mrs Melrose with his compliments, and hopes as she'll enjoy them; "which no doubt, she will," says I, "as they're some of the finest you've got, sir."'

During this speech, which for Mrs Perkins was one of unwonted length, the housekeeper winked incessantly at Maria, to attract her special attention, and at the end of it pressed a note into her hand, with a whispered admonition to put it into her pocket and read it when alone.

'What are you dawdling out there for so long, Maria?' Mrs Melrose cried shrilly from the sitting-room.—'Oh, what beauties!' she pursued, as Maria entered bearing Mr Heavysides' gift in a basket. 'How kind, how thoughtful of the dear man to send me such a delicious present!—Give Mrs Perkins a glass of sherry, Maria—not the best,' she added in a lower tone. 'Also, Maria, tell her to convey my compliments to Mr Heavysides and my best thanks. He must have been aware of my penchant for grapes.'

As soon as the companion could steal away for five minutes to her own room, she hastily tore open and perused the note given her by Mrs Perkins. It was very brief, and surprised her not a little. 'DEAR MISS STONOR'—thus it ran—'You will probably be astonished by the request I am about to make—namely, that you will call upon me without delay; nor would I so far trouble you were I not suffering from a slight attack of gout. I have something of great importance to communicate to you; and as I am unable to leave home, I trust you will so far humour me as to come to see me as soon as an opportunity presents itself?—Please, let no one know I have written to you.—I am yours very truly,
GEORGE ALEXANDER HEAVYSIDES.'

'What can he want to tell me?' Maria pondered. A conviction—even a suspicion—of the truth never crossed her mind.

'Maria! Maria!' rang out the piercing tones of Mrs Melrose. 'Come here at once; I want you.'

The poor drudge hastened in answer to the imperious summons, and found Mrs Melrose busily employed in eating the grapes brought by Mrs Perkins. 'Maria,' she said, 'I wish you to go out to do a little shopping for me. Please, get ready immediately.'

'Yes,' murmured Maria in a dreamy voice, gazing into vacancy, her faculties still absorbed by the mysterious contents of Mr Heavysides' note; 'get ready, yea.'

Mrs Melrose bestowed on her a chill and haughty stare. It was thrown away, however; Maria was completely unconscious of it or its significance—entirely oblivious of Mrs Melrose's presence.

'Maria!'

With a start she came out of her brown-study, and a comical look of terror spread over her face. 'I beg your pardon, Mrs Melrose,' she began; 'I did not mean to be'—

'No excuses, please, Maria,' broke in the matron in glacial tones. 'If you don't think it worth while to pay attention to what I am saying, pray tell me. I am not an exacting mistress, Maria, far too indulgent, as is evidenced

by the fact that you so little heed what I say. I have been too kind to you, Maria, that is the truth; and I have long thought, Maria, that you have ceased to value your situation.'

Now, although Mrs Melrose spoke thus decidedly, it was far from her intention that her humble friend should really leave her. Maria was much too useful to be parted with in a hurry; and Mrs Melrose merely wished to strike terror to her dependent's heart. She did not imagine for a moment that she would be taken at her word. But she reckoned without her host. A worm will indeed turn if pressed too hard; and a certain undefinable elation inspired by Mr Heavysides' note, notwithstanding that she had not the remotest conception of why he desired to see her, caused a sudden feeling of loathing against her tyrannous mistress to arise in poor, down-trodden Maria's mind; and this feeling made her reply to Mrs Melrose: 'Indeed, I think you are right; I have stayed with you too long; I will leave this day month.'

Astonishment held Mrs Melrose speechless—astonishment not unmingled with uneasiness. What if Maria really meant what she said? Where could she (Mrs Melrose) find such another docile slave?—But pooh! it was ridiculous. In another week Maria would be begging and praying to stay. 'And then,' said the worthy dame to herself, 'I will not be conciliated in a moment; I will make her drink the cup of humiliation to the very lees.'

Maria left the room without another word; and, having put on her outdoor clothes, proceeded into the village—a thing she would not have dared to do under ordinary circumstances, but rebellion was rife in her heart, and she cared not whether Mrs Melrose were pleased or the reverse. She directed her steps at once to Mr Heavysides' house.

'My dear Miss Stonor,' the old gentleman exclaimed heartily, 'I am most pleased to see you. It is indeed kind of you to come so promptly in answer to my request.'

Maria smiled, and said nothing.

'Miss Maria,' went on the old man, and he took the little woman's hand in his and pressed it gently—a very different pressure from the one he had bestowed on Maria's mistress the day before—'Miss Maria,' he repeated, 'are you happy with Mrs Melrose?'

Maria looked down, but remained silent. Mrs Melrose was certainly not very kind to her, but her heart was too loyal to disparage the woman whose bread she ate.

'Ah! I see,' Mr Heavysides proceeded; 'you do not like to say. Well, my dear, I honour you for it; but I am afraid you are not happy, and, my dear, I want to make you happier—at least I try to persuade myself I do. Nevertheless, I believe I'm nothing but a selfish old fellow, and that it's my own comfort I'm thinking about all the while.—Miss Maria, will you marry me? I'm a cross-grained, grumpy wretch, with powers of making myself extraordinarily disagreeable; but I want somebody to cosset and make much of me; and if only you'll come to me, Miss Maria, I'll alter—upon my word, I will.'

Maria was crying softly to herself.

'Don't cry! don't cry!' implored the old man. 'Why should you cry?'

'You are so good,' murmured the little woman. 'Rubbish! Bosh! Nonsense!' he exclaimed, looking very fierce. 'Pooh! Fiddle-dee-dee!'

And then the two fell a-talking; and little by little Maria forgot to cry, as she told her future husband about the events of the past two days. Mr Heavysides was greatly tickled, especially when Maria said with much innocence: 'There's one thing I cannot understand: Mrs Melrose told me that the name of the lady you were going to marry was well known to me; but I am sure I was very far from her thoughts.'

Then her sexagenarian lover recounted to Maria what had passed between himself and the widow, and though Maria said, 'Fie, for shame!' she could not forbear to smile.

'And now, my dear, listen to me,' began Mr Heavysides, when he had laughed at Mrs Melrose to his heart's contentment. 'I don't know how you are off for money, and I don't want to know; I don't suppose she'—meaning the widow—'gives you too much; but you must take this to buy yourself what you require for the wedding.' And he opened a desk and took from it a fifty-pound note, which he pressed into her hand. '—Another thing, my dear: you must give Mrs Melrose a month's wages in lieu of notice, and leave her house at once—this very day. Telegraph to your sister in Cornwall that you are going to stay a few weeks with her, if she can find room for you. I'll see about the banns, and we'll be married in three weeks. I'll have no license; every one shall know that we're going to be married. It will give them a longer time in which to say, "There's no fool like an old fool."'

On reaching home, Maria found Mrs Melrose just sitting down to luncheon. 'Maria,' she asked with icy politeness, 'may I venture to inquire where you have been all this time?'

'In the village on some business,' replied the companion.

'And pray, how was it that you did not ask my permission before going?' demanded Mrs Melrose.

'Because I did not think it probable you would give me it,' Maria retorted boldly.

'How dare you answer me like that?' cried the infuriated woman. 'How dare you?' she reiterated, her true nature—that of the virago—coming to the surface, at the same time rising with clenched fist and advancing towards the really terrified Maria, as if about to fell her to the ground.

Just then the door opened, and in hobbled Mr Heavysides. O' all people in the world he was the very last whom Mrs Melrose desired to see at that moment. Try as she would, she could not compose her features to a natural expression.

The old man stood speechless with amazement. 'Goodness me!' he at length gasped out, 'are you ill? What is the matter?'

'Matter?—matter enough!' fumed Mrs Melrose, unable to repress her spleen. 'This woman, this Maria Stonor, who has lived beneath my roof for the last eight years, to whom I have been more than a sister, whom I have invariably treated as an equal—penniless dependent though she is—this woman, I say, has dared to grossly insult me in my own house.'

'Gracious!' ejaculated Maria, 'what have I said?'

'Said, minx?' retorted Mrs Melrose; 'said? Why, you'—

'Mrs Melrose,' Mr Heavysides interpolated, calmly, 'I had not intended to make it public quite so soon, but your remarks compel me to inform you that Maria Stonor is my future wife.'

Had a thunderbolt fallen at her feet, the widow could not have been more dumfounded. She was literally aghast. The room spun round with her. This, indeed, was the ruin of all her hopes, of her cherished ambition. With an effort, she pulled herself together. Her mind was chaos, a cataclysm; but one idea at last took definite shape, standing out clearly amidst the overthrow of all her plans: Maria must be conciliated. It would never do to be ill friends with the future Mrs Heavysides—a person able, were she so disposed, to confer many a favour on the widow.

Never had Mrs Melrose detested human being as she detested Maria Stonor at that moment, and never had she addressed her in more honeyed accents. 'My dearest Marie,' she cried—though she could not prevent her lips twitching, or banish the ominous glitter from her eyes which belied her words—'this is truly a pleasant surprise for me, the more so from its very unexpectedness. Allow me to congratulate you, Marie. When is the wedding to take place? You'll be married from my house, of course? I cannot say how glad I am that you are going to settle and have a home of your own at last.—I was only joking just now,' she explained, turning to the bridegroom elect. 'I knew you would see it was merely my fun—for Marie has been a faithful little companion to me; a dear good girl, if a trifle flighty and wayward sometimes; and we have never had a really cross word since you first came to me—have we, child?'

Maria was not deceived by this sudden change of manner, but having a peace-loving disposition, that disliked the idea of being unfriendly with any one, she took Mrs Melrose's words in good part, and cordially thanked her for her good wishes.

The following morning the now happy dependent escaped from the thralldom in which her mistress had so long held her, and betook herself to her sister's home in Cornwall, whence in due course she set out on her honeymoon, a bright and joyous bride. The future stretched out fairly before her. She had done for ever with the dependence of genteel slavery.

The wily Mrs Melrose, whose attempts to entangle Mr Heavysides had been too palpable to escape comment, spent the entire three weeks preceding Maria's marriage in disarming the sarcastic pity of her acquaintance.

'I know you thought, my dear,' she was wont to say with apparent frankness, 'that I was setting my cap at my sweet Marie's fiancé; and she and I had many a laugh together over it. The truth is I was for ever sounding my little friend's praises into his ears.' And she repeated this so often, that in time she half-believed that it was so, and prided herself not a little on having brought about the match.

And as neither Mr nor Mrs Heavysides cared to contradict her, it came to be an accepted fact

in Wychford that it was by Mrs Melrose's agency that Maria had so comfortable a home; and many a bashful mother wished she knew a Mrs Melrose to do the same for her daughter.

ILLUSTRIOUS HANDWRITING.

'EVERY man,' says Lord Chesterfield in one of his Letters—'every man who has the use of his eyes and of his right hand can write whatever hand he pleases.' Lord Chesterfield was in his own day 'the glass of fashion and the mould of form,' and wrote an excellent hand himself; but his dictum is far too sweeping. For, though

True ease in writing comes from art, not chance,
As those move easiest who have learnt to dance,

there are some people who find good handwriting unattainable in spite of the most persevering efforts. For instance, Byron's penmanship was rude and unfinished in youth, and in later life it became wretched. Macaulay, too, though he polished his periods with the greatest care, wrote an unlovely scrawl. It may be supposed that Dean Stanley had 'the use of his eyes and of his right hand,' but his 'copy' was so illegible that the printers charged half-a-crown a sheet extra for setting it up. The late Lord Houghton, however, put them all in the shade; his handwriting was so ineffably bad that it was often a sheer impossibility to read it.

In olden times the doughty barons of England wielded the sword and the battle-axe with prodigious vigour, but disdained the pen as fit only for monks and priests. Even kings were sometimes lamentably ignorant. Henry I. had indeed some taste for literature and lampreys; but his great-grandson, King John, of unhappy memory, was not similarly blessed. The original 'Magna Charta,' which may still be seen in the British Museum, does not appear to be signed by the king or any of his barons with their own hands. Possibly some of them may have been reluctant to remove their steel gloves; though there is no doubt that many a proud noble of that age was unable to sign his name. Later on, however, it was not considered a disgrace for the sovereign to know 'the three Rs.' Henry VIII. wrote a firm, bold hand, as might be expected from his temper. Queen Elizabeth wrote a pretty hand in her youth, but as she grew older it became more angular and irregular. The chirography of Mary, Queen of Scots, was like herself, elegant and graceful. Cromwell's hand was bold and determined: the conqueror of Naseby and Worcester, of King, Lords, and Commons, was not likely to hold a hesitating pen. Charles II. wrote quickly and carelessly: he was too fond of pleasure to take pains. George IV.'s hand was large and flowing—a credit to 'the first gentleman in Europe.' Queen Victoria's writing shows the effects of age, but she still makes a capital signature.

Napoleon I. was never distinguished for excellence of penmanship. When he became Emperor he used to sign his name—'Napoleon'—at full length, though the signature was even then not remarkable for beauty. Later on it dwindled to 'Nap.' Still later, a crooked hieroglyph, bearing

some distant resemblance to an N, was the Emperor's sign-manual. His writing was indeed so hopelessly bad that Josephine is said to have taken one of his letters from Germany for a map of the seat of war! The Third Napoleon wrote a good legible hand.

As a rule, great generals have been but indifferent scribes. Washington, however, wrote a good hand; and so did Wellington in early life, but in his old age it became practically undecipherable.

Poetic handwriting is of various degrees of excellence. Moore, Rogers, Coleridge, and Wordsworth all wrote a fair hand. Gray took almost as much pains with his caligraphy as he did with his 'Elegy,' which cost him seven years' labour. Addison wrote a large, clear hand, the letters well formed, but each too proud or too coy to touch its neighbour. Burns wrote a large, bold, manly hand: there is vigorous independence in every stroke of the pen. The Ettrick Shepherd's writing was crooked and ill formed. Leigh Hunt wrote his charming essays in a charming hand. Thomas Campbell's writing was sloping and not graceful: it lacked the force and fire which one would expect from the author of 'Ye Mariners of England.' W. C. Bryant wrote a small, carefully finished hand; while N. P. Willis wrote his 'Pencillings by the Way' as if he were always in a hurry. H. W. Longfellow's writing was upright, round, open, heavy—a boon to printers. Bayard Taylor wrote a very fine hand. Lord Tennyson polished his poetry with the most loving care. So fastidious was he that he had his poems set up in type, to see how they looked in print before sending them to the publisher. His handwriting corresponded to his poetry in elegance, beauty, and finish. Henrik Ibsen, the Norse poet, writes a round, clear hand, sloping backwards. Miss Olive Schreiner says of him that 'he and George Meredith are the only men of modern times who understand women.' Nevertheless, Ibsen's portraiture of the ladies is sometimes the reverse of flattering.

Notwithstanding the lapse of time, Sir Walter Scott still occupies a commanding position amongst our novelists. In early life he wrote a legible hand, though, being

A clerk foredoomed his father's soul to cross,
Who pens a stanza when he should engross,

his stanzas displayed more character than his chirography. Towards the close of his career, when the great mind became obscured, his manuscript was crabbed, blurred, and altered so as to be almost unreadable. Fenimore Cooper appears to have written his numerous novels with a burnt stick. Nathaniel Hawthorne's handwriting was irregular and indistinct. Dickens says he never copied, always sending the original draft of his works to the printer. The printer, however, would have been better pleased if Dickens had copied; for his manuscript is written in a galloping slapdash style, frequently blurred and altered, and very difficult for the compositor to set up. W. M. Thackeray's manuscript is entirely the reverse. It is free from blots and erasures; the writing is clear, neat, regular, and nearly upright, the words well apart: in short, a pleasure to read.

Generally speaking, our statesmen have been pro-

ficient in penmanship, though Lord Brougham's writing in his old age became nearly illegible. Pitt, Fox, Canning, Peel, Lord Derby, Earl Russell, all wrote a good hand. Lord Palmerston was distinguished among his colleagues for the beauty of his calligraphy. In his earlier years Mr Gladstone's writing was clear and regular; and age has not withered the variety of his mind or deprived his right hand of its cunning.

Voltaire and Rousseau were both remarkable for clear and beautiful calligraphy. 'Junius' wrote a fine, flexible, suggestive hand, though it failed to suggest the writer's identity. R. W. Emerson wrote a careless, irregular scrawl. O. W. Holmes writes a neat, clear, dainty hand, whose beauty the wear and tear of time have not destroyed. The genial Autocrat of the Breakfast Table, who has lately given us 'Over the Teacups,' has written with the same gold pen for the last twenty years; and may that good gray head continue for another twenty years to enrich our literature and our lives with its noble thoughts!

About the beginning of the eighteenth century, ladies wrote a large, round, open hand, not much unlike the Italian. As the century grew older, the light, angular style of our grandmothers and great-grandmothers came into vogue. Feminine handwriting was then painfully uniform; individuality was almost unknown. Latterly, however, our girls have asserted their independence in this direction, as in so many others, and the Civil Service style is now much affected. Among ladies distinguished for the beauty of their penmanship—or penwomanship—was Charlotte Brontë, who wrote a very small, very delicate, and carefully finished hand. Mrs Hemans wrote in a free, flowing style. Elizabeth Barrett Browning's manuscript was very neat, and carefully punctuated, the writing being distinct and legible, though the letters were not well joined.

In 1833 a Baltimore literary paper offered two prizes—one for the best tale, and one for the best poem. The adjudicators attracted by the beauty and distinctness of the writing on one of the papers sent in, unanimously decided that the prizes should be paid to 'the first of geniuses who had written legibly. Not another manuscript was unfolded.' So says Rufus W. Griswold in his biography of that wayward American genius, Edgar Allan Poe. According to Mr Ingram, however, this is not only erroneous, but absolutely false; and indeed it seems on the face of it incredible that a number of cultured gentlemen and leading citizens should dishonour themselves by deciding the merits of papers they had not examined. Mr Ingram has succeeded in unearthing the published award, and therein it is stated: 'Amongst the prose articles were many of various and distinguished merit; but the singular force and beauty of those sent by the author of "The Tales of the Folio Club," leave us no room for hesitation.' So, after all, Poe did not owe his success to his penmanship, exquisite as that undoubtedly was.

Some years afterwards, Poe, in a series of 'Papers on Autography,' maintained that a man's character may be discovered in his handwriting. This thesis he enforced and illustrated with marvellous ingenuity. His genius was decidedly analytical, and the inferences he drew from the

specimens he gave were very often accurate. While admitting that there is much truth in Poe's theory, it is equally true that handwriting is in many cases no certain index to character. The weather, the health, the nerves, feeling, passion, may agitate the mind and make the pen forget its wonted firmness.

If individual character influences individual handwriting, national character should influence national handwriting. Authorities tell us that such is the case; that the art of the Italian, the pride of the Spaniard, the vivacity of the Frenchman, are all displayed in their penmanship. It may be so; but, as a rule, it would take an expert or an enthusiast to tell the difference between the writing of the shrewd Scotsman, the staid Englishman, and the lively Irishman. German handwriting, however, is truly indicative of the national character: it requires nearly as much patience to read it as to write it. On the other hand, one seeks in vain to discover the temper of a Jew from the dots and points of Hebrew, or to decipher the character of Mr Pitman from the phonetic alphabet.

In China, printing and writing are always respected, and the autographs of high dignitaries are revered. Upon ceremonious occasions a great man is attended by his servant, who hands him a small piece of paper every time he wishes to blow his nose. To use a pocket-handkerchief would be a Western innovation, and a shocking derogation from the dignity of a Mandarin. Printed or written paper is, however, never used for this purpose, being considered too sacred. The use of red ink is forbidden to all but the Emperor, who signs official documents in this flaming colour. An autograph of Kang Hsi, the contemporary of Louis XIV., has been sold in Peking for more than forty pounds. The Chinese seem to have anticipated the fashions and foibles as well as the arts and sciences of our own day. Their golden youth, with long pigtailed and almond eyes, sat at competitive examinations when the conquering Norman was riding roughshod over our Saxon forefathers. Verily, there is nothing new under the sun!

IN AUTUMN DAYS.

In Autumn days, when leaves are shed
In eddies, amber-tinged and red,
Along the coverts of the wold—
When ferns are turning ruddy gold,
And acorns patter overhead—

When in the shallows of its bed
The river sighs dispirited,
There is an ancient legend told,
In Autumn days:

A tale of one who has been led
Among the lilies, forest-wed,
To nourish memories of old,
Who wakes to find the nights are cold,
The birds have flown, the flowers are dead,
In Autumn days.

BEYOND THE VERGE.

Two intrepid travellers have recently started on journeys of discovery, both having the North Pole as their ultimate bourne. Of the two, Lieutenant Peary has chosen the more prosaic route, across Greenland with dogs and sledges; he also took with him some Colorado donkeys, but these have already succumbed to storm and cold. Mrs Peary and one other woman accompany this expedition. Mrs Peary joined her husband in his first expedition to the north coast of Greenland in 1891, having been the first of the weaker sex to tempt the perils of Polar discovery.

Meanwhile, Dr Nansen, the brave enthusiast, leaving his young wife and child behind him, has started in his good ship the 'Fram' on a voyage which he believes will occupy at least five years, during the greater part of which he expects to be frozen up on a moving mass of pack-ice, and to be thus carried by ocean currents across the Polar basin and back along the coast of Greenland. It is a bold and romantic enterprise, and deserves success; but most geographers doubt the existence of the currents upon which Nansen relies, and shake their heads ominously as to the fate of the explorer. And indeed, should there be any truth in the theory of a certain American, neither of the explorers can ever reach the Pole, for the very simple and sufficient reason, that there is no North Pole to reach.

Americus Symmes, the son of a well-known but eccentric father, in order to show his filial piety, according to the 'San Francisco Chronicle,' is organising an expedition to follow the wild animals across Greenland to 'Symmesonia,' an imaginary land, with a delightful climate, and teeming with enormous herds of reindeer, musk-oxen, and other animals, which he believes to exist in the centre of the earth, in a region which he hopes to open out for emigration!

The theory of Symmes's father was, that the earth is a hollow sphere, habitable, and inhabited in the interior; and that, after passing eighty degrees north latitude, vessels cross what he

denominated 'the Verge,' and sail southwards into a cup-like hollow leading into the interior of the earth. This quaint and altogether untenable theory caused considerable amusement at the time it was first propounded, in 1818, by its originator, Captain John Cleves Symmes, of the United States Army, who sent out a circular to all the learned Societies in Europe and America couched in the following terms: 'To ALL THE WORLD.—I declare the earth is hollow and habitable within, containing a number of concentric spheres, one within the other, and that it is open at the Poles twelve or sixteen degrees. I pledge my life in support of this truth, and am ready to explore the hollow, if the world will support and aid me in the undertaking. . . . I ask one hundred brave companions, well equipped, to start from Siberia in the fall season with reindeer and sleighs on the ice of the frozen sea. I engage we find a warm and rich land, stocked with thrifty vegetables and animals, if not men, on reaching one degree northward of latitude eighty-two degrees. We will return in the succeeding spring.'

But Captain Symmes could not get together his one hundred trusty followers; and after lecturing for years and petitioning Congress many times in vain for aid, he died in 1829, and his project sank into the limbo of forgetfulness, excepting that his grave is still marked by a hollow globe of marble with the inscription: 'Captain John Symmes was a philosopher, and the originator of Symmes's Theory of Concentric Spheres and Polar Voids. He contended that the earth is hollow, and habitable within.'

One would have imagined that with the fuller knowledge of the Arctic regions acquired since the death of this eccentric philosopher, the belief in 'Symmes's Hole' would have entirely died out; but, on the contrary, it seems to be reviving in America; and his son, who must be an old man, is even now preparing to lead an expedition, for which he says he has had seventy or eighty volunteers, in order to prove the truth of his father's theory. 'The expedition,' he says, 'is for

no other purpose than to follow the wild animals out of Greenland into Symmesonia—the name given to that country by my father. Where the animals go, we can certainly follow, as we will go prepared for snow and ice travel as well as land; and we will have a boat to cross rivers, should we have to do so. No doubt we can live in a great measure off the animals on our travels. They will soon lead us into a mild climate, where the soil must be rich and productive. The only reward that we expect is that, if we are successful, it will immortalise the whole party, and will open up a new world for emigration.

The earth, according to Symmes, is constructed somewhat on the plan of those concentric balls so ingeniously carved by the Chinese, at which we have all marvelled: there are spheres within spheres, divided from other spheres by very light gaseous matter, the water of the ocean in places percolating right through to the centre or great mid-plane; and in like manner the earth in certain parts connects the separate spheres, and holds them together. Around the great central hole north and south, the ice and snow are accumulated, forming what we know as the Arctic and Antarctic Circles; and these are denominated 'verges,' and are supposed to occupy twenty-five degrees of latitude. But this icy barrier once passed, Symmes imagines an open Polar Sea, dipping gradually into the centre of the earth, and forming the happy breeding and feeding place of myriads of fish, from whales to herrings, the surrounding land enjoying a delightful climate, and teeming with so-called Arctic animals—reindeer, foyes, hares, &c., all finding therein shelter from the cold, and ample space for grazing on the rich verdure supposed to abound there.

Unfortunately for this hypothesis, Lieutenant Lockwood, who, in Greely's expedition, passed beyond this supposed verge, and attained to latitude $83^{\circ} 23' 8''$ north, and should therefore have entered upon Symmes's charming Polar Under-world with its myriads of fish and terrestrial animals, found even in May nothing but ice and snow, with here and there a scanty vegetation, just sufficient to sustain a few hares, ptarmigan, and snow-buntings, which, with lemmings, bears, and foxes, seem to have been the only animals seen during sixty days' march; whilst the mean temperature was below zero Fahrenheit during forty-five days, and that in April and May, when in those latitudes the sun would be above the horizon almost continuously. Looking out over the ocean towards the Pole, no fine open sea, teeming with whales, seals, and shoals of fish, presented itself, but, far as the eye could reach, 'a vast expanse of snow and broken ice.' Nevertheless, crustaceans were dredged up, tracks of wolf and fox found, and hares and ptarmigan met with—showing that life probably exists even to the Pole, although wholly insufficient to supply with food even a single sledge-party; so that Lockwood and his companions were obliged to return earlier than they wished, in order to avoid starvation, having eaten only at intervals of fifteen, twenty-four, and nineteen hours, to enable them to travel farther; whilst their dogs were reduced to desperation by famine, and could not

be kept from thieving and gnawing everything, even to the ammunition.

So far, therefore, there seems in actual fact nothing to support the theory of Symmes as to the open cup-shaped hollow of the Polar Sea, and the abundance of life therein and on the coasts adjacent. Still, traces do exist of open water in the Polar seas, especially in a great tide-crack, as it is called, which varies from a few feet to several hundred yards in width, and in the moving ice which has been seen and felt by many Arctic voyagers.

It is this movement of the Polar ice-pack drifting always southwards, thus proving the existence of Arctic currents, which has encouraged Dr Nansen to attempt the hazardous feat of reaching the Pole by allowing his vessel to be frozen up near the New Siberian Islands, where the 'Jeannette' was sunk in 1881, believing that the moving ice-pack will carry him and his vessel across the ocean close to the Pole, and bring him down south, along the coast of Greenland, after the lapse of three or four years, as seems to have been the case in regard to some relics from the 'Jeannette' which were picked up on the coast of Greenland three years after the loss of the vessel.

Mr Seebohm, in his presidential address to the Geographical Section at the late meeting of the British Association, which with its six polar charts illustrative of the temperature, vegetation, &c., of the Arctic regions is of great interest, pointed out very clearly the more substantial reasons for Nansen's faith in Arctic currents. Not only do the Mackenzie and the great Siberian rivers flow into the Polar basin, but the Gulf Stream three or four hundred miles wide, enters it between Spitzbergen and Finmark, supplying the Norwegians at Hammerfest with driftwood from the Gulf of Mexico, whilst to compensate for this immense influx two return currents from Arctic regions pass one on each side of Greenland, bringing the Eskimos firewood from the forests of Siberia.

Mr Symmes will do well to await Dr Nansen's report before starting on his quixotic expedition. Nansen had at least some reason for his belief, and the support of two or three names well known in Arctic research, and he did not start with any unfounded hope of delightful climate and abundance of food supply, but prudently took with him everything necessary for his support during his long and untried voyage of discovery; and if he fails, it will not be for want of forethought. He knows from experience the difficulties and dangers which await him; and we all trust his courage and enthusiasm may be rewarded with the success they deserve. Meanwhile, we can but marvel that the wild, bleak, and desolate regions surrounding the Poles should have called forth so many daring adventurers to endeavour to probe the mysteries which lie at the 'Back of the North Wind.' The attraction doubtless lies in the unsolved mystery, which gives scope for much speculation, varying in character according to the religious or philosophical bias of the speculator. Hence, whilst Symmes and his followers expect to find a cup-like hollow at the Poles, leading into the interior of the earth, another American, Dr W. F. Warren, writes a book to prove that the Garden of Eden was situ-

ated at the North Pole. He shows by many quotations from ancient authors of various nationalities, that a mountain, which he places at the North Pole, was regarded as the abode of the gods: the Olympus of the Greeks, the Mount Meru of the Hindus, the 'Mountain of the World' of the Akkadians, the Pearl Mountain of the Chinese, the Mount Sion of the Bible; and that upon this mountain, at the very apex of the world, was supposed to stand a pillar, which he identifies with the earth's axis, and which in legendary lore connected the earthly with the heavenly paradise, and was symbolised as a tree, by which the faithful ascended to the abode of the blessed: the Tree of Life of Moses, the Yggdrasil of the Scandinavians, the Sacred Tree of many other ancient races, the Bean-stalk of the nursery tale.

Dr Warren, like Symmes, believes in a delightful climate and an exuberance of life at the North Pole; but he is content to assign these to the Miocene period of geologists. In this he is in accordance with verified facts, for the discovery of large seams of coal, and of fossil trees including magnolias, both in Greenland and in Grinnell Land, testify to the former existence of a semi-tropical climate, where now all is ice and desolation; but Miocene man is at present only a dream of anthropologists; and to consign Adam and the Garden of Eden to the North Pole in Miocene times is to place them very decidedly 'Beyond the Verge.'

POMONA.*

CHAPTER XIV.

The sun of love shines on her; all the air
Is warm with adulation; only she
Like marble statue flushed and made more fair
By very radiance, still stands cold and free
From sign of yielding.

EMMA RHODES.

'You won't expect me to-morrow,' Maurice had said when he parted from Sage, the evening of the private view. 'I have some business to see after in the morning; and in the evening I have promised to dine with that cousin of mine, Mrs Copleston, in Brook Street. I met her yesterday morning in the Park, and she made me promise to come, though it's a horrid bore. I think if I get a chance this evening, I shall tell her about you and me, Sage. She's such a jolly old girl, and I'm sure you'd like her. She's not a bit stuck up or fine, though she's very well off, and knows all sorts of nice people. I'll take you up to lunch one day. I should like her to know my little girl.'

And Sage agreed, as she would to any proposal that ended like that—only, in her heart of hearts, she wished that Maurice's friends were not all so fashionable; it complicated the future prospect of the little suburban house and the economies to be practised there.

After the exquisite enjoyment of the day before, the ordinary routine of home-life seemed rather dull; and she felt the separation from Maurice ever so much more now that he was in

London, when every footstep outside might be his, or knock at the door announce his coming. It is often more difficult to endure a slight separation than a greater one, parting for a day than for a year, the distance of a few hundred yards than that of a continent. Perhaps this is because the heart has not time to learn the sad lesson of patience, and in the greatest separation of all—though, is it indeed the greatest?—when death us do part, there often springs up in the bereaved a strength of resignation you would not have looked for in some clinging, exacting nature, that could not till then bear her loved one to be out of sight.

And so Sage was crosser that day than the boys had ever known her, and Will was quite electrified at her disgust and indignation at finding his pocket-handkerchief hung to dry in front of the fire, and the energetic way in which she bundled the Pink un and all his belongings out of the way.

Maurice, too, was not perhaps in the very best of humours that day. He had seen the sudden look of disappointment on Sage's face when he had said that she must not expect him next day, and had felt an odd little mixture of compunction and irritation. The former impelled him to say that perhaps he might come for half an hour in the afternoon; the latter prevented him from doing so. It really could not be expected that he should go every day to Dalston—it was such a pilgrimage from any habitable part of London. Sage was the dearest, best of little girls; but, of course, a man had something else to do, and the best of girls are apt to forget this and grow exacting.

As a matter of fact, he had nothing else to do; and he felt remorseful, and perhaps also a little dull, as he sat alone smoking in Ludlow's studio, for Owen had not come back yet, and Maurice had Collins's house to himself; and though it appeared to Sage that he had so many fashionable friends and relations in London, he really had very few, having been abroad so much of his time.

More than once during the day, he was inclined to cast overboard the masculine dignity and prestige of having something else to do, and go and find Sage, being sure—that is the worst of men, they are always so sure, and the annoying part is they are generally right!—that there would be no need of explanations, but that her face would light up with glad welcome; and that she would believe with humble gratitude that he had given the go-by to important business all for her sake.

But he did not yield to this temptation, but took a nap and another pipe, and then it was time to dress for Mrs Copleston's dinner. There is something particularly exasperating in dressing; but when once evening clothes are donned, the temper generally improves; and by the time Maurice reached Mrs Copleston's house, his usual amiability was restored, and her pleasant, cordial reception of him was very agreeable.

'You are a good boy to come,' she said. 'You seemed so very uncertain yesterday as to whether you had not some other engagement, that I began to suspect a stronger attraction elsewhere. I have been expecting a note or telegram all day with your excuses; and I don't think I could

* Copyright reserved in the United States of America.

ever have spoken to you again. But as you have come, I am going to reward you by sending you down to dinner with one of the prettiest girls of the season. Yes; and one of the richest, too, and as far as is known, heartwhole at present; so, if you play your cards well, Master Maurice, there is no knowing what may happen.'

Maurice was among the earlier arrivals in the pretty, tasteful drawing-room, where the soft light from pink shaded lamps fell on exquisite flowers, and on all the easy, indescribable elegance that pervades some people's rooms, and to which others cannot attain, however much money and thought and pains they bestow on it.

Colonel Coppleston received him as kindly as his wife had done. He was generally known among his acquaintances as Mrs Coppleston's husband, and was well content to play that part in life, having a most unbounded admiration for his more brilliant wife, and no wish to assert any individuality of his own, independent of her.

Maurice was standing talking to him as the other guests arrived, and, being in the recess of one of the windows, did not observe the rest of the company till dinner was announced, and a tap from Mrs Coppleston's fan summoned him to be introduced to the lady he was to take down to dinner. 'Miss Lester, Mr Moore.'

It was Pomona, and Pomona so much the more like her picture as the evening dress of the present day is more classical than the out-of-door morning costume, the hair being dressed in almost exactly the same style, with the big loose knot behind and the soft curls on her forehead.

As they passed down-stairs, Maurice said: 'I had the pleasure of meeting you yesterday at the private view, I believe?'

'Do you mean that you met me myself, or saw this wonderful likeness that my friends tell me one of the pictures bears to me?'

'Both,' he answered. 'I could not fail to observe the likeness.'

'Isn't it a very curious thing? There is something quite uncanny about it, for, do you know? I have never seen the artist. I do not even know his name. Some people think he must have painted it from a photograph of mine; but I do not photograph at all well, and have never had a satisfactory one taken; and the picture is certainly more like me than my photographs are; though, of course, it is very flattering.'

'I do not think that,' Maurice said, looking down at the sweet bright face, whose changing expression no picture could do justice to.

'I did not say that to draw out a compliment. But I should so like to find out more about it. Captain Mostyn has promised to find out who this Mr Ludlow is.'

'I think I can save him the trouble. He is one of my oldest friends.'

'Is he really?' She turned to him with such a delighted look of interest, that Maurice felt he was one of the most fortunate of men, and hoped that the other men at the table saw it and envied him. 'Oh, do tell me about him.'

'He is a splendid fellow: there is no one like him.'

'Is he young?'

'No: fifty, I should say.'

'Where does he live?'

'Generally down at Scar, a little seaside place in Dorsetshire.'

'I don't think I have ever been in Dorsetshire since I was a baby.'

'He has been in London lately.'

'Then do you think he could have seen me?'

'No; I am quite sure he has not, for he must have seen the curious likeness to his picture; and it is all the more curious as I know he had begun painting the central figure more than ten years ago.'

'Really! Are you quite sure of that?'

'Perfectly; for I saw it ten years ago in California, where I was with him something like six months.'

'Then that is conclusive that it was not taken from me, for I was quite a little girl then. Do you know who was his model?'

'No one, as far as I know. I believe he drew it entirely from memory.'

'Of some one he had known?'

'Yes—some one he had known, and who had died.'

'Were all the figures painted from memory?'

'No; the others were from models, and painted more recently.'

'Do you know,' she said, 'that some of my friends are not satisfied with finding the likeness to me, but declare that the girl in the right-hand corner bears an extraordinary resemblance to some of the portraits of our family? But I think this is imagination on their part. I don't mean the little, rosy-cheeked girl; but the pale one in a dull green dress. They never can make out any likeness between me and the Lesters; and I am not sure that I care about it very much, as some of them are decidedly plain.'

'Then I should not think there could be any likeness.'

'Thank you,' she said with a laugh. 'But do not trouble to be so complimentary.—Was the girl in green taken from a regular professional model?'

'Oh no; she was a young lady that Ludlow met down at Scar last year.'

'Do you know her?'

'Yes, a little.'

In looking back in days to come, Maurice wished he had not spoken so indifferently. Without being effusively communicative, he might have conveyed the impression that he knew Sage well; but these coolly spoken words seemed to commit him to appearing merely as a slight acquaintance of the girl he was going to marry.

But at the moment he spoke, how could he tell that he would ever meet that beautiful Miss Lester again, or that it would matter what she thought the relation between him and Sage to be?

'Do you know,' she said, 'there is one remarkable thing in the matter which many, even of my friends, do not know?'

'May I know it?'

'I have a very curious Christian name,' she said.

'I think I heard that lady opposite address you as Mona.'

'Yes,' she answered; 'that is how I am generally called; but it is not my whole name—that is Pomona.'

And here the ladies rose to leave the dinner-table; and in the drawing-room Maurice had no further opportunity of conversation with her.

(To be continued.)

A HERMIT NATION.

BURIED deep in the heart of Asia, and separated from the burning plains of India and from the populous regions of China by stupendous ranges of snowy mountains, there lies a wonderful land. This land is Tibet. Its physical features are most remarkable, for the country seems to consist of a vast central plateau, the greater portion of which lies at a higher elevation than the top of Mount Blanc, and from which descend on all sides great valleys, traversed by the Hoang-ho, the Yang-tsze-kiang, the Brahmaputra, and the Indus. The Tibetans themselves are a morose and gloomy race, and, sunk in poverty and filth, seem to be degraded members of the human family. But perhaps it is the religion of the Tibetans which is the strangest feature of the country, for the Tibetans are Buddhists of a most extraordinary character. All over the mountains in the inhabited portions of Tibet are scattered the convents of the Lamas, which are full of monks and nuns, and are ruled by abbesses, and by Lamas in red and yellow robes, with mitres on their heads, and with tridents and praying-wheels in their hands. Multitudes of pilgrims traverse the roads which lead to the holy city of Lhassa, the capital of the country; and in the great temple at Lhassa, which is splendidly adorned, the Buddhist priests and monks chant the service, in the presence of crowds of devout worshippers.

Another wonderful thing connected with Tibet is the jealous way in which it is guarded by its inhabitants, and the extraordinary care taken by them to prevent Europeans from entering the country. On the side of India every mountain-pass is carefully watched, and any European who attempts to enter Tibet from this direction is instantly turned back. On the side of China the frontier is guarded with equal care, and so perfect is the cordon in this quarter, that although the borders of Tibet may be reached, they cannot be passed.

Sir Joseph Hooker travelled for many days through the forest-clad mountains of Sikkim towards the Tibetan frontier; but his coming had been announced, and a guard of Tibetan soldiers met him and his attendants on the frontier, and compelled them immediately to retrace their steps. Dr Andrew Wilson passed the Tibetan frontier, but was stopped at the first village by a crowd of Tibetan women, who refused to allow him to pitch his tents; and as the women were supported by the men, he was compelled to turn back.

The Indian Government has lately trained Hindu Pundits to travel in Tibet and make scientific observations; but even this has to be done with great secrecy, and their scientific instruments have to be carefully concealed. On the frontier, these Hindus are strictly examined by the Tibetans, and are frequently turned back. Often, however, they are successful; and after traversing unknown portions of Tibet, they return to India and report their discoveries to the officials

of the British Government, by whom they are rewarded. The most remarkable journey undertaken by these trained Hindus was performed by the Pundit Nain Singh in 1874. He entered Great Tibet from the west, and leaving the headwaters of the Indus, ascended to a vast table-land, divided by a range of mountains from the Brahmaputra on the south, and stretching away for an unknown distance towards the north. Having reached Lake Namcho, he crossed the snowy mountains which rise along its southern border. Then he entered the habitable portion of Tibet, with its towns, convents, and monasteries, and ultimately made his way into Assam, and thence to Calcutta.

In 1889 two French travellers, M. Bonvalot and Prince Henry of Orleans, undertook to enter Tibet from the north; and they have given us an interesting account of their wanderings in a book lately published—*Across Tibet*, by Gabriel Bonvalot. They started from Semipalatinsk, in Siberia, in June 1889, and made their way to Kuldja, an important town just within the Chinese dominions. Here they made the acquaintance of Father Dedeken of the Belgian Mission, who agreed to join them, as he was returning to Europe. Leaving Kuldja, they first crossed the snowy chain of the Thian Shan, the giant peaks of which, known as Bogda-Oola and Tengri-Khan, reach an elevation of twenty-one thousand feet; and traversing a barren country in which the vegetation was limited to the banks of the streams, they arrived at the little Chinese town of Kourla, and here their troubles began. The governor of Kourla professed friendship, but secretly informed the Chinese leading official of the district concerning the European travellers. Shortly afterwards, an order arrived from this great man saying that the Frenchmen must be turned back; but M. Bonvalot and his companions refused to retrace their steps. Chinese soldiers then arrived to stop them, and orders were sent in all directions for the inhabitants of the neighbouring districts to report in what direction the Europeans were journeying, so that they might be turned back. The travellers, however, bravely set out; and although the governor of Kourla threatened to use force to drive them back, he shrank from carrying out his menace, and the travellers proceeded on their journey.

They now descended into the basin of the Tarim, which is a wilderness, and is being slowly buried beneath the sands which are drifting over it from the desert of Gobi. Vegetation and agriculture are limited to the banks of the stream, and these are fast drying up. The Tarim as it runs to the east becomes narrower and shallower, until at last it loses itself amidst a great swamp of reeds which once was called Lake Lob. Even this swamp is drying up, and the aspect of the whole country—which is being fast buried beneath the sand—is melancholy in the extreme. Great towns formerly existed here, but the drifting sand has buried them, and the whole of this part of Asia presents a melancholy spectacle of decay and desolation. The wild camel is found in this neighbourhood. It was formerly abundant near Lake Lob and along the slopes of the Altyn Tagh; but it now exists only in the desert east of the Tarim. It runs rapidly, and is very sagacious;

and the natives hunt it, and sell its skins to travellers.

At last, on November 17, 1889, the adventurous Frenchmen left all signs of human dwellings and human occupations behind them, and bidding adieu to the little town of Tcharkalik on that day, they plunged into the wilderness in which they were to wander—amidst fearful privations—for a long and dreary period.

They first ascended the Altyn Tagh or 'Golden Mountains,' which constitute the southern boundary of the basin of the Tarim, and form the first and lower rampart of the great Tibetan table-land on the north. Great gorges, and barren slopes covered with stones, and sandy ravines devoid of vegetation, spread out on all sides. Still, though winter fast closed in upon them, the explorers pushed on, and at last found themselves deep in Tibet. Their sufferings now became most severe. They were in a wilderness of gigantic mountains, which was totally uninhabited. The snow-storms raged around them day after day, and so awful was the cold that Fahrenheit's thermometer often marked twenty, thirty, and even forty degrees below zero, and on one occasion it actually sank to forty-eight degrees below zero!

Notwithstanding the horrors of the climate, the travellers saw many wild animals in these Tibetan solitudes. Myriads of antelopes careered over the desolate plains; great wild-sheep with splendid curved horns stood on the summits of the rocks; foxes and hares ran about the ravines; and wolves frequently made the lonely nights resound with their dismal howlings. The great wild yak was often met with. Sometimes a single one was seen standing on the top of some rocky eminence gazing fixedly at the travellers, and on other occasions great herds of these magnificent animals were discerned on the mountain sides. The wild ass was also plentiful, numbers of them galloping over the barren wastes, and often congregating in troops. Nor were birds absent: partridges were heard calling on the mountain sides, crows flocked around the camping-places, and great eagles soared overhead. Man alone was totally absent from these solitudes.

As the expedition advanced it attained a higher elevation, and at length a mountain range was crossed the height of which was estimated at twenty-six thousand feet, while the plains around were from seventeen to eighteen thousand feet above the sea. In the midst of this icy wilderness, M. Bonvalot and his companions discovered several extinct volcanoes, from which descended great beds of lava and cinders. One of the volcanoes they named Mont Elisée Reclus, and another Mont Ruysbruk; whilst in the midst of the lava-fields which flowed from these volcanoes they found a beautiful lake. Another sign of volcanic action was the hot springs and geysers which were often encountered. Some of the geysers rivalled those of Iceland in size, but were fast frozen by the intense cold. Lakes were often met with, some of which were salt; in fact, salt lakes fast drying up were continually discovered; and a plain crossed by the travellers was found to be covered with salt a foot in depth.

And so for many a dreary week the travellers struggled on, going ever towards the south, but apparently only getting deeper into the awful wilderness. Their camels and horses died one

after another; and at last death fastened upon their attendants. A camel-driver was the first to perish. Unable to resist the fearful cold, he gradually sank; and his body was buried in the ice, in the midst of a blinding tempest of snow. It was the first death in the caravan, but unhappily not the last. The only hope of saving the lives of the remaining members of the little company now lay in their pushing on as rapidly as possible, and in meeting with some human beings, whom they now longed to see. But New-year's day approached, and still no signs of Man. In fact, this part of Tibet is quite uninhabited during the winter; and it is only in the summer that the pastoral tribes bring their flocks and herds to graze on these great plains, which on the approach of winter they abandon for the milder regions farther to the south.

Presently, the hopes of the travellers were raised by their seeing the remains of human encampments which had not been long abandoned, and they cheered themselves with the thought that they should soon see human beings. At last, on the 31st of January, one of their attendants came running to M. Bonvalot and his companions in a state of great delight, and joyfully declared that he had seen a man! It was even so. A Tibetan was approaching, and he was the first human being—except the members of the caravan—whom the travellers had seen for nearly two months; and worn out as they were with hunger and exhaustion, the sight of a man was truly delightful. Several Tibetans came up and conferred with the travellers; but nothing definite was gained from them. On the next day more Tibetans arrived, riding on shaggy mountain ponies; but they were reserved and suspicious. They at once tried to turn the travellers back, and their chiefs declared that they would be punished if they allowed the Europeans to proceed. M. Bonvalot and his friends were determined to go on; for to return in their condition would have been certain death; and so they pressed forward as fast as their exhausted frames and dying horses and camels would permit. The country seemed to be getting less savage, but it still consisted of great snowy mountains and open plains without the least cultivation, on which the black tents of shepherds rose here and there, and herds of wild asses were roaming to and fro. At last, on February 3, 1890, the travellers gained the summit of a lofty range, and looking to the south they saw the great Lake Namcho—the Holy Lake of the Tibetans—lying beneath them. It was a glorious spectacle. The broad expanse of the lake stretched away like the sea; promontories ran out into its bosom, and islands rose from its surface in many places. On its southern shore rose the great snow-clad mountains of Ningling-Tangla, whose towering peaks attain an elevation of twenty-five thousand feet, and are looked upon with awe and veneration by the Tibetans.

By this time the neighbourhood was thoroughly aroused; messengers had been sent to Lhasa, and horsemen were observed in all directions on the plains, and they surrounded the travellers on every side. These latter were now so weak that farther progress seemed impossible; and the Tibetans would neither give nor sell them any-

thing, and seemed determined to let them die of starvation. Their meat was frozen so hard that they had to chop it with a hatchet, and all their remaining beasts were dying. And now another of their attendants fell ill, and rapidly grew worse. In the darkness of the wintry night the survivors watched round the sufferer, but could do nothing. As the wolves howled round the camp, the dying man felt his end approaching, and calling his comrades round him, he bade them all farewell; then he fell backwards, and his spirit fled. They buried him at the dawn of day, and raised a pile of stones over his grave.

At this critical juncture when the caravan seemed doomed, an *amban* or petty Tibetan magistrate arrived from Lhasa, and peremptorily ordered the travellers to retrace their steps. This they refused to do, and they declared that they would rather die than return through the awful wilderness. The *amban* was perplexed, and declared that he would be put to death if the Frenchmen did not turn back. Ultimately, he agreed to write to his superiors at Lhasa for instructions. Time passed on, and by-and-by a great caravan, containing the leading Tibetan officials from Lhasa, arrived at the place where the travellers were encamped. These important personages—who were the religious and civil governors of the country—proceeded to encamp in great state; and at a solemn conference they ordered the Europeans to leave Tibet by the road they had entered it. M. Bonvalot and his companions still refused to go back a single step, and matters began to look very critical. At length the Tibetans gave way, and granted permission to the travellers to go to Batang, and thence to Tonquin. They also agreed to supply the Frenchmen with provisions and beasts of burden, and to furnish them with a guide to the frontier. These terms were willingly accepted; and shortly afterwards, provided with horses, yaks, servants, and provisions, the Europeans bade farewell to the Tibetan officials, and started in an easterly direction for the Chinese frontier.

They journeyed along the southern edge of the great Tibetan table-land, now ascending to its broad expanse, and now descending into the deep chasms by which its southern front is furrowed, and through which flow the headwaters of the great rivers of Siam and Cambodia. It was now spring, and the weather was much warmer, while grass and bushes were seen on all sides. Often great views were opened up to north and south; and it was observed that while the mountains to the south were precipitous and heavily snow-clad, those which rose to the north on the great table-land were rounded, and only slightly streaked with snow. At last, on the 14th of April the travellers caught sight of a house, the first they had seen for five months! Shortly after, they had a glimpse of cultivated fields, which they had not seen since they had entered Tibet. The hillsides now were—on the lower slopes—covered with bushes and with fir-trees, the villages were surrounded with cultivated fields, and the dwellings of Buddhist hermits were often seen perched on the tops of the towering crags.

On the 8th of June the travellers reached Batang, on the great river Yang-tze-kiang, and shortly afterwards they arrived at Ta-tsen-lu,

the frontier town of China. Here they had trouble again with the Chinese authorities, and had to submit to many insults. Fortunately, they met at this place Mr Pratt, an Englishman, who undertook to convey their natural-history specimens to Shanghai. Once more they started; and at length arrived safely in Tonquin, and embarking at Haiphong, they reached Hong-kong, and from thence were carried to Marseilles.

PHYLLIS MARSDEN'S LOVE-POEM.

CHAPTER III.

'GRACIOUS! Harry. Wonders never will cease. Here is actually an invitation to dinner from the old hermit.' And Kitty flourished a dainty note in her brother's face.

'What old hermit? This sounds interesting and out of the common,' replied her brother, looking up from the breakfast table.

'Why, Phyllis, of course! At least her father. The note is from Phyllis. Listen! "Papa is most anxious to ask Captain Benson's opinion." Well, really! I do hope you feel flattered. Never shall I forget the old gentleman asking my opinion once! I feel hot whenever I think of it.'

'And what did you do?' asked her brother lazily.

'Never gave him the opportunity of asking another, and never shall, either!—The invitation is for Thursday. Phil won't be home, and I am engaged to dine somewhere, never mind where. So you are the only victim.—Stay; what is over the leaf? "P.S.—I have just remembered Mr Huxtable will not have returned home by Thursday; but do come, Kitty. Captain Benson will be bottled up all the evening with papa, and we can have a long chat."—No, no! Phyllis. Much as I enjoy your society, a long dinner seated next your revered parent would be quite beyond my powers of endurance.' So saying, Mrs Huxtable whisked up her letter and disappeared into her boudoir.

Captain Benson leaned on the mantel-shelf, a frown on his bronzed open face. 'She has never taken the least notice of the lines I sent, though I am sure they were pointed enough. She never seems to see; and for the life of me, I daren't "put it to the touch, and gain or lose it all." Three months' more leave, with a possible extension of three more. It's not a great deal of time. Still, it is a point gained to get the entrée of the house. "Lose it all!" Never! I'd wait three months, three years, or thirty, sooner than that should happen.'

And Captain Benson leaned his head on his hand, and gazed meditatively into the fire.

The eventful evening arrived. The three intervening days had been spent by Phyllis in various ways, and in more than one attempt to recover her lost letter. Several times she had taken the opportunity of her father being engaged elsewhere to prow round the study. She had investigated the paper basket, peeped

into many neat little elastic-banded heaps of notes; but without result. The letter had mysteriously disappeared. Of one thing, however, Phyllis felt certain. Wherever it might be, her father's eyes had never rested on it; and in that thought she took comfort.

Never before had she seen her father so interested. The pile of manuscript notes he unearthed would have occupied many evenings only to glance through.

'Any one would suppose papa expected Captain Benson to stay three weeks instead of three hours. I am afraid when they meet, papa will be a good deal disappointed. I can't imagine his taking a *real* interest in such fustiness!'

Arrayed in a white dress of some soft clinging material, which appeared to have been gracefully draped on to her slight supple figure, Phyllis descended the wide oak staircase, her candle held high aloft. She glanced back at a tall 'coffin clock' that stood in a nook of the staircase.

'Dear me! I am dreadfully late! It is on the stroke of seven!' And she hastily blew out her candle, and setting it on the hall table, turned to the drawing-room.

'Oh! how you startled me! I had no idea you were here!' And Phyllis, blushing, held out her hand to a tall figure, which at that moment was emerging from the drawing-room door.

'I must apologise, both for startling you and for being before my time.' Captain Benson held aside the *portière* for Phyllis, as they passed into the drawing-room. 'Kitty had an engagement to dine with the McKenzies, and dropped me here *en route*.'

At that moment Mr Marsden appeared, with a cordial welcome. If he was in any way surprised by the early arrival of his guest, he was far too well bred to show it; and the interval before dinner passed easily and cheerily.

During the meal, Mr Marsden spoke little, and the ball of conversation was kept rolling by Phyllis and their guest. Many reminiscences of the pleasant weeks spent in the summer were reproduced and laughed over; and Phyllis felt quite regretful when, dessert ended, she had no alternative but to leave Captain Benson and her father to entertain each other.

'He really is nicer than any one else!' mused Phyllis, as she sat on a stool and leaned her head against the side of the chimney-piece. 'I think papa *must* like him, even if he is disappointed in his cleverness.'

'No, thanks! I don't care to smoke. I would far rather set to work at once;' and Phyllis heard the study door close on her father and his guest.

Half an hour later, the study bell rang.

'Papa is going to have coffee in the study. I suppose I had better go there.'

She rose. The study door stood open. Robins had just entered with a tray. Phyllis stood on the threshold, transfixed with astonishment. On the cleared table was spread an enormous map; Captain Benson was leaning over it in an excited manner, tracing out a route with his forefinger; while Mr Marsden—Phyllis could hardly credit her eyes!—was leaning over him, one hand placed on the shoulder of the younger man, and a delighted, interested expression on his face. Phyllis had never seen there before.

'Just as if they had known each other all their lives! I am certainly not wanted there!'

Phyllis retraced her steps, saying as she did so: 'You can bring me some coffee in the drawing-room, Robins.'

Nine o'clock, ten struck; and still the two men sat on, eagerly discussing the literature, manners, and customs of the country each was so interested in. Anecdote succeeded anecdote, adventure followed adventure; till at last Captain Benson, taking out his watch, said: 'It is almost too late now to settle to steady work; isn't it, sir? But you will let me come again—won't you?—and go through these poems with you. I can come round any evening that suits you.'

'Come as often as you can,' answered his host cordially. 'You have made me feel ten years younger.—But stop a minute! I had quite forgotten one thing.' A curious look of perplexity overspread Mr Marsden's face. He stopped short, and looked at his guest with an almost piteous expression in his eyes. Then, taking out a bunch of keys, he opened a drawer in his writing-table and took out a paper.

Captain Benson watched him curiously.

'I had quite forgotten in the pleasure you have given me that I had another reason for wishing to see you to-night. It is better I should be quite honest with you.' He looked steadily at his guest. 'Captain Benson, I don't like that!' So saying, he placed the open letter in his hand.

If a thunderbolt had fallen, Captain Benson could not have felt more astounded than when he recognised in the paper in his hand his own letter to Phyllis. His bronzed face flushed crimson; but his blue eyes met Mr Marsden's fearlessly.

'I presume Miss Marsden gave you these verses?' He looked inquiringly at his host.

'No. She does not know I have seen them. They came into my possession by accident, among some papers she was copying for me, and'—answering a look in the other's eyes—'I had seen them before I realised they were of a private nature. The letter was folded as you see it now; I could hardly flatter myself the verses were addressed to me.' Mr Marsden smiled grimly. 'When I turned the sheet, I saw they were addressed to my daughter.' He paused, as if expecting Captain Benson to offer some explanation; but none being forthcoming, he went on.

'You have interested me greatly; but if you continue to come to my house, it must be distinctly understood that there is to be no more of this sort of thing.'

'What is your objection to me?' inquired Captain Benson.

'Objection! I don't think I object to you. On the contrary, I like you much.'

'Then I don't understand the difficulty.'

'My daughter is very young; and—and—we know so little of you!' faltered Mr Marsden.

'Time will remedy the first of your objections; so we can put that aside,' replied Captain Benson. 'For the second, I cannot agree with you. Miss Marsden and I were staying, as you doubtless remember, for six weeks in the same house; so our acquaintance can scarcely be called superficial. It is true I have not had the pleasure of knowing you before this evening. But that is through

no fault of mine; for I repeatedly asked Miss Marsden to allow me to call on you when I returned to town, and she invariably told me it would be useless, as you never saw any one.' He glanced inquiringly at Mr Marsden.

'It is quite true. I have been very wrong,' Mr Marsden replied, humbly.

Captain Benson was touched as he looked at the bent figure and the grieved expression with which his host made this confession. He moved his chair nearer. 'Let us talk this over,' he said, leaning forward. 'You say you have no objection to me personally. That is well. I hold a good appointment. I have ample means. I have youth, and excellent health; and, last though not least, I love your daughter.' Captain Benson coloured as he added this last recommendation.

'I did not know it had gone so far,' murmured Mr Marsden helplessly.

'It has gone so far that I cannot possibly withdraw, as you suggest, with honour. I have done everything in my power to make your daughter like me, and to show my love for her, short of actually asking her to be my wife; and I should have done that before we left Dunveith, but that she seemed so unconscious, and I feared to startle her by being too abrupt.—Of course,' he continued, finding Mr Marsden did not speak, 'if you, knowing all this, forbid me your house, I shall have no alternative but to respect your wish. In a few months I return to Persia for three years. At the end of that time, Miss Marsden will be of age; and I warn you I shall then leave no stone unturned to win her for my wife.'

'And I shall have all this to go through again, I suppose, and very likely Phyllis will be unhappy in the meantime!' sighed Mr Marsden. 'And to think of this going on and my never knowing it. I thought Phyllis quite a child.'

Captain Benson smiled. 'I fear you would miss her terribly if you gave her to me.—But why not come out yourself to Persia, and revisit some of your old haunts?—Come, Mr Marsden: you will not now forbid me the house. Let me come to-morrow, and'

'And read the love-poems,' put in Mr Marsden. 'Well, perhaps it will be the shortest way out of my difficulties. I expect Phyllis has gone to bed.—No; the light is in the drawing-room. You can bid her good-night.'

Reader, shall we leave them? Nay, let us rather exercise our privilege, and for an instant draw aside the curtain of the future.

On the deck of a Peninsular and Oriental steamer lying off Gravesend all is bustle and confusion; for in a few minutes the bell will ring, the tender will put off, and the last of the passengers will be on board. On deck, those on board are waving a last adieu to their friends on the tender. One group only interests us. Standing apart is Phyllis—the same bright, merry Phyllis—but with a new love-light in her eyes; and bending over her a tall, handsome soldier, also an old acquaintance. But who is this?—the last person to leave the tender. Surely not—but, yes; it is Mr Marsden, alert and active, with binocular slung across his shoulders. Six months of the bracing presence of his son-in-law had acted as a marvellous tonic; and he is now proceeding to Persia, he would say for six

months, and Phyllis and her husband humour him.

The last whistle! the last adieu and waving of hands! The great steamer is under way. Let us wish them God-speed!

PIRACY IN FAR EASTERN SEAS.

PROBABLY every school-boy who was ever worth his salt, at some early period in his teens has sighed because the decadence of piracy as a regular profession necessitated his selecting some more prosaic career in life. Without in any way wishing to encourage his youthful aspirations to emulate Blackbeard or Captain Kidd, or the other worthies of the Spanish Main; and, on the other hand, without desiring to arouse the fears of those of his elders who contemplate running over to Calais, or up to Scarborough, or even across the Atlantic, it may be very truthfully pointed out that piracy is still more or less regularly pursued as a business by thousands of people in various parts of the world. Execution Dock is no longer decorated with dangling gibbets, it is true, and the successor of Tangier's terrible Dey now relies on voluntary visitors for part of his revenue; but the *loup de mer* still infests many a sea, and nowhere does the genus flourish as it does in far Eastern waters.

The Peninsular and Oriental, the Messageries Maritimes, and other China-bound great lines, all expressly stipulate in their charters and bills of lading and agreements with passengers, that they shall not be held responsible for loss caused by 'fire, pillage, or piracy.' Piracy, forsooth, on a five-thousand-ton vessel, speeding at eighteen or twenty knots an hour, along familiar courses, through waters policed by the navies of a score of civilised nations! Yet the condition is not superfluous, even in these end-of-the-century days. For instance, a very serious case of piracy occurred near Hong-kong, on the steamer 'Namoa,' in November 1890, when a crowd of Chinese passengers shot the captain and another European dead, wounded several officers, and looted the vessel, escaping in junks, which sailed up when the victorious signal was hoisted. But although the engine had been disabled, the boilers emptied, and the side-lights thrown overboard, the engineers got the vessel headed for Hong-kong before dawn. The writer had the felicity, a few months later, of seeing a number of the piratical gang made a head shorter. The scene—with its background of rugged hills, the gunboats in the middle-distance, and an evil-smelling beach lined with nineteen dispirited, haggard, unkempt wretches, waiting till the mandarin gave the signal to begin—which signal was delayed until half-a-dozen amateur photographers had obtained a satisfactory focus—the scene, I repeat, was one which will take long to efface from the memory. One of the condemned wretches, in particular, made an unpleasant impression. He was alleged to be the leader of the attack on the 'Namoa;' and as he

was brought to the village Aceldama trussed like a fowl and squatting on a basket, he raved vain-gloriously about his crimes in pigeon-English and Chinese alternately. 'I shall come back in eighteen months and haunt you all,' he threatened. The allotted time is now long past; but Mak Aloï has not yet revisited the pale glimpses of the moon.

China is peculiarly the pirate's happy hunting-ground, and nowhere does he flourish more, strange to say, than in the neighbourhood of the most civilised centres in the south, such as Canton, Amoy, and Foochow; and this, too, notwithstanding the existence of a fleet of small but swift gunboats specially detailed to patrol the rivers, in order to suppress freebooters and smugglers. Comparatively the other day, a steam-launch belonging to a resident at Canton—an English ex-naval officer—was seized by a dozen of these desperadoes under the very nose of the authorities, in broad daylight, and used for a while in pillaging some of the myriad craft which navigate the West River, being ultimately left derelict. Even in Hong-kong, within sight of Government House, these water-wolves have established a regular colony. They refer to their excursions euphemistically as 'going East;' and many an instance of their boldness and cruelty could be given if space permitted.

Although the Japanese are to a great extent a maritime people, and by no means wanting in courage, they are rarely found resorting to this method of livelihood. But on the other side of the Chinese Sea, along the Cochin-China coast, every other native follows it. Although British gunboats have destroyed hundreds of their junks, burnt scores of villages, and hanged a host of men, sailing into Hong-kong harbour time after time with a pirate dangling from every yard-arm, within the memory of comparatively young men—notwithstanding this, and the intermittent efforts at repression made by both the Chinese and French Governments, the shores of Tonquin and Annam are still a terror to navigators, owing to the hordes of well-armed and desperate natives whose canoes are hiding in every creek. Safe in their shoal-girt fastnesses, aided by spies, they swoop down on rich cargoes, or kidnap well-to-do merchants with an audacity that is incredible.

Coming nearer home, we find piracy still very far from a myth. The corsairs of the Malay Peninsula long ago gained a bad eminence; what novel is complete without its chapter on the becalmed brig, assailed by a fleet of praus in the Straits of Malacca or Sunda, massacring the crew previous to carrying off the hero and heroine into a gilded captivity? It is not in romance alone that the Malay pirate exists. One of the best-known figures in Singapore to-day is that of a Chinaman whose arms have been cut off above the elbow, and who lives on the charity of a few residents. A few years ago, the 'Hong-kong,' or cargo-boat of whose crew he was a member, was

attacked just outside Singapore harbour. He and his mates jumped overboard; and when he tried to save himself from drowning by clutching the rudder, the merciless marauders severed his arms with a couple of blows. Fortunately for him, an English pilot was cruising about not very far away in a launch, and steamed up on observing the disturbance. After picking up the men who were in the water, he arrested the six Malay pirates; and a few weeks later they were satisfactorily hanged, the armless Chinaman being provided with a special seat among the spectators in front of the gallows!

It is hardly within the province of an article on piracy to refer to the seizures of vessels in harbour, such as that of the 'Hok Canton' at Achéen in 1885; but whilst in these equatorial latitudes, mention must be made of a British pirate, once the terror of navigators in Eastern seas, who died in 1886 or 1887, at a ripe old age. He had been a man of herculean frame, though old, poor, and racked by rheumatism, when the writer knew him. One of the Scottish Stuarts, he must have taken to evil ways early in life, for tradition attributes to him exploits over half a century ago to which only the pen of Robert Louis Stevenson could really do justice. But no one knows the details. He was not unnaturally reticent on these matters; and it was only by calculating on his violent temper, and 'drawing' him by artfully worded references to some alleged outrage, that anything could be got out of him. Often have I heard him cry querulously, 'I never hanged a woman in Siam!'—and then he would launch out into a narrative of what he had done—how he had been a captive of the Cochin-China authorities, carried about naked in a bamboo cage for nine months; how he had been twice sentenced in Singapore to imprisonment for life, and released through the influence of his brother, an officer high in the East India Company's service, and—this with a boastful air, at which, nevertheless, one scarcely cared to smile—he had never been anything but a pirate!

Only quite recently a paragraph went the round of the papers, announcing a terrible tale of piracy. It was reported from Penang, that the Dutch vessel *Rajah Kongsee Atjeek* had been taken possession of between Penang and Achéen in July of this year by her Achéenese passengers, who murdered the captain (an Englishman), two English mates, and twenty-two members of the crew. The chief mate was a native of Aberdeen. The cargo was left intact by the pirates, whose leader was the Achéenese supercargo. Seven of his accomplices went aboard at one of the ports of call after the Customs officers had examined and left the steamer. This irregularity probably led to the disaster, which resulted in the pirates securing five thousand guilders as booty. Obtaining this, however, they also killed twenty-four passengers and wounded twelve, while eighteen others who escaped in a boat were drowned by the craft capsizing owing to overcrowding. Nineteen passengers and thirty-two of the crew were unarmed. The man at the wheel was first cut down with a sword,

then the chief mate was killed, and next the captain was slain in his cabin, these murders being followed by a general slaughter in the saloon.

THE MONTH: SCIENCE AND ARTS.

THE most important scientific event of the past month has been the meeting of the British Association at Nottingham, which, while it has not brought forward any great discovery or invention of a sensational character, has been full of interest to those desirous of keeping themselves posted with regard to scientific progress. Full reports of the addresses to the various sections appear in the *Times* and many other papers, and a perusal of these will give the reader a fair idea of the work of some of our best men. Some of these addresses are of a highly technical character, while others trench upon matters of more popular interest. The next meeting of the British Association will take place at Oxford, when the Marquis of Salisbury—whose scientific attainments are well known—will take the presidential chair.

Among the more popular items brought before the meeting at Nottingham was the address in the Mechanical Science Section, in which the subject of locomotion on land introduced the cycle. Of this modern vehicle the speaker, Mr J. Head, spoke in the highest terms, and said that by it the most wonderful increase to the locomotive power of man on land was obtained. One mile had been cycled at 27.1 miles per hour; 50 at 20, 100 at 16.6, 388 at 12.5, and 900 miles at the rate of 12.43 per hour. Comparing these speeds with the speed and endurance of horses, Mr Head referred to the recent race between German and Austrian cavalry officers, which gave rise to so much comment in the press. The winner performed the distance, about 388 miles, in 71.33 hours, equal to 5.45 miles per hour, and his horse has since died. Mr L. Fletcher cycled from Land's End to John o' Groat's house, 900 miles, in 72.4 hours, equal to 12.43 miles per hour, or more than double the distance that the winner of the cavalry race rode, and at above double the speed. Here is indeed a triumph for the cyclist, who has the farther advantage of reflecting that in a long-distance ride he is guilty of no cruelty to an uncomplaining beast.

At the Congress of Journalists recently held in London, many most interesting papers were read, and among these was one of especial interest, by Mr W. L. Thomas of the *Graphic*, who took for his subject illustrated journalism. After tracing the history of this phase of journalism, the reader of the paper, who has been associated all his life with writers and artists, and is therefore in a position to speak with some authority, prophesied that in the future 'the increased power of faithfully recording pictures of current events, will be by the aid of increased discoveries in photography and electricity.' This prophecy is based upon the instrument recently invented by Professor Elisha Gray, called the *Telautograph*, specimens of the

work of which were exhibited before the audience. The telautograph faithfully reproduces at one end of an electrical circuit a line drawn at the other end—save that the reproduced lines are slightly thickened in the process.

Before jumping to any hasty conclusion as to the value and probable utility of an invention like the telautograph, it is as well to look back into the past in order to see what has been done by others in the same direction, and in such a case reference to old textbooks is invaluable. Thus we learn that half a century ago Bakewell's telegraph was able to transmit a drawing executed in the first instance on tinfoil by a varnish-like ink. Later on this form of instrument was much improved upon, and later still Cowper's *writing* telegraph made it possible for a man to transmit his autograph—under certain limitations—by electric wire. So that the advance in the instrument now introduced by Professor Gray is not so great as it would seem at first sight to be. What is really wanted is the means of doing for the eye what the telephone and phonograph have accomplished for the ear. Such an instrument does not seem outside the range of possibility, but it will need a genius to work it out.

One of the greatest and most important monopolies ever created by the patent laws of Britain expires this year. The period of fourteen years for which the holders of the incandescent electric lamp patents were, very rightly, protected comes to an end, and the manufacture of the glow lamps which are now in use in so many thousands of buildings is thrown open to the world. The profit on the manufacture has hitherto been enormous, a lamp costing only ninepence retailing at from three shillings and sixpence to four shillings. Aladdin's lamp itself could hardly bring more profit to its owner than has this little glass bulb inclosing a carbon filament. The price will now come down, for competition is not only threatened from home manufactories which are ready for immediate work, but from Germany and America. But the consumer will do well to guard against the purchase of too cheap a lamp. It will clearly be more worth his while to pay say a florin for a lamp with a life of seven hundred hours, than to purchase two for the same amount, having a combined life of five hundred hours. The present manufacturers will yet be able to kill competition if they reduce the price to a reasonable figure, and will at the same time guarantee a lamp of the old efficient kind.

Messrs Fletcher, Russell, & Co., of Warrington, have introduced a new method of colouring iron-work, which, it is said, entirely prevents rust, even though the metal be brought to a red heat. Indeed, they are treating the gas stoves of their manufacture with the compound. The preparation can be made to assume any desired colour, either dull or polished, and all tints are said to be quite unchangeable. The value of such an invention cannot be overestimated, and it is one which will be welcomed by the decorative designer as well as by the engineer.

Many persons find a difficulty, when looking through a microscope, in keeping the unoccupied eye closed, or if they keep it open, in ignoring the image which it receives of external objects. Dr L. B. Hall of Philadelphia has invented an attachment to the microscope eyepiece which obviates

this difficulty. It consists of a vulcanite shield which can be brought over the eye not in use, so as to darken it for the time being. Skilled microscopists by practice attain the power of keeping both eyes open while at their work, and at the same time concentrating their attention upon the image received by one only. A little practice enables one to do this with the telescope also, and the muscular strain of keeping one eye closed is thus got rid of with great comfort to the observer.

The Corinth Canal is now open to the passage of ships. The work of construction was begun as long ago as April 1882, but it has been interrupted for financial reasons more than once—and the rock through which the channel is cut offered difficulties both in its hardness and height. The canal, for the most part, represents a waterway with a perpendicular wall of rock on either side. It is not quite four miles long, and has an average breadth of one hundred feet. Steamships bound for Constantinople from the Adriatic will save eighteen hours by traversing the Corinth Canal, and Marseilles steamers will in like manner save eight hours.

Any busy man who has experienced the annoyance of waiting at a telephone while the wire he wants is occupied, as he learns through the exchange, by another person, will be inclined to welcome the introduction of an instrument called the Telephonometer. This instrument will register the time of each conversation at the telephone, from the ringing up of the exchange to the conclusion of the conversation. Talking would thus be charged for, like gas, by meter, and garrulous beings would have the wholesome check of expense before them. The Telephonometer has its origin in the German telephone department, where for the future it will control the duration of telephonic conversations, and determine their cost.

It is estimated that in London alone twenty-five thousand horses are employed in the carrying trade, and that their value is a million and a quarter sterling, or fifty pounds per horse. Their food costs eight hundred thousand pounds per annum, and is calculated in rather a curious way, the amount of forage consumed by each animal being based upon its height. The rule is that a horse should cost to feed as many shillings per week as he stands hands high.

It is probable that in the near future horse traction in our streets will be superseded to a great extent by electricity. An omnibus driven by storage cells has frequently been seen of late successfully steering its way through the heavy traffic of some of the principal London thoroughfares. A company at Chicago have placed upon the market an electric carriage which is constructed to carry four persons at the rate of seven miles an hour, and another form of electrically driven vehicle has been introduced in Italy. In each of these cases a small electric motor is employed which receives energy from battery cells carried on the vehicle.

A new system by which smokeless combustion of coal is rendered possible, has been adopted by the North German Lloyd and the Hamburg-American Packet Companies as the result of some successful trials at Berlin. The system is briefly as follows: The coal is in the first place reduced

to powder in centrifugal disintegrators, and is then conveyed by a jet of steam or compressed air into pear-shaped combustion chambers lined with fire-brick. This combustion chamber takes the place of an ordinary furnace, and the coal dust brought within it by the steam or air jet is dispersed over the whole extent of the chamber and becomes at once ignited. Moreover, as each particle of coal is separated from its neighbour and held in suspension, the oxygen necessary for complete combustion attacks it on all sides, and no wasteful smoke escapes. After the initial combustion of the dust, the air or steam jet can be reduced and regulated according to the amount of dust necessary to produce the required quantity of steam. If air be used, it can previously be heated by waste gases, and thus present an element of economy.

The recent coal strike will have the effect of calling renewed attention to the use of liquid fuels, and this will be particularly the case with our railways, which are put to enormous expense and inconvenience when any stoppage of the coal supply occurs. The Great Eastern Railway are already fitting up twenty-five locomotives with Holden's liquid fuel apparatus, which will burn almost any kind of crude oil or tar. At present these liquid fuels can be had in any quantities at a cheap rate, and it behoves all users of steam power to turn their attention in that direction for the probable solution of the fuel difficulty.

That unsavoury subject, the disposal of the Metropolitan Sewage, has occupied the attention of many thinkers during the last few decades, and we are glad to see that the last remedy adopted has been to a great extent successful in clearing what once was called the silver Thames of its pollutions. During the past twelve months the plan adopted has been to carry the sludge—or solid matter deposited by the sewers—far out to sea in specially constructed tank steamers, and there to discharge it—instead of allowing it as heretofore to putrefy in the river and upon its banks. As an unmistakable testimony to the increased purity of the Thames owing to this innovation, fish are once more ascending the stream. Whitebait, shrimps, and small crabs have come up the river as far as Gravesend and Erith, and according to Dr Günther salmon and sea-trout in the grilse state make their appearance at the mouth of the river, 'ready to ascend and restock the stream as soon as its poisoned waters shall be sufficiently purified to allow them a passage.'

Many serious and even fatal accidents have occurred from the passage of atmospheric electricity along telephone wires during a storm. Recently at Metz, during the progress of some target practice by a regiment of field artillery, a soldier who approached a telephone receiver at the moment that the conducting wire was struck by lightning, was killed, while a companion was paralysed by the shock. It has long been believed that if persons struck by lightning were treated by the artificial respiration system adopted in the case of the drowned, life might often be saved, but this treatment does not seem to have been tried in the case mentioned.

An Indian paper advocates the use of a coloured material for hats as a protection against

sunstroke, and a correspondent writes to say that he has had all the linings of his hats and coats made of yellow material for the past five years. To this simple precaution he attributes his immunity during that period from fever and sunstroke—often under circumstances of extreme exposure. Previous to the adoption of these yellow protectors, he was a victim to both forms of disease.

The Mammoth Cave of Kentucky is remarkable for the extreme purity of its air, and the curious physiological effect of breathing it for a period of twelve hours has been recently described by Dr Hovey, the geologist. He found that his perception of smell was increased to such an extent, that after emerging from the cave every tree, person, and common object seemed to be endowed with a distinct odour. This recognition of smells previously unrecognisable caused violent nausea, which lasted for about half an hour and then subsided. The effects are attributed to the extremely pure air of the cave, as well as to the absence for so many hours of anything to stimulate the olfactory sense. In other words the nose, being at absolute rest for so long a time, became extremely sensitive to odours which ordinarily make no impression whatever.

A correspondent of the *Lancet* points out that when sugar is partly burnt in a gas flame it is destructive to mice. He lately baited a trap with burnt sugar, and in the morning found within it a mouse quite dead, and another one lying outside the trap also dead, the sugar having disappeared. This is somewhat disquieting, for burnt sugar, or caramel, is used as an ingredient of many articles of food. May it not be possible that the gas flame may have conferred upon it poisonous properties?

DANNEL THE CARTER.

THE stable is quite dark and silent; the five great cart-horses stand motionless; only the mice are lively as they scuttle across the loft above, making a horse prick occasionally a drowsy ear. By-and-by streaks of red light begin to steal under the door, where the patient feet of the horses, passing in and out year's end to year's end, have worn the stones down. Gradually the shadowy forms of the horses grow out of the darkness; as the light gets stronger, they stir, and there is an air of expectancy about them; then all the ears prick up, and all the heads turn towards the door as a footstep is heard coming through the yard—a brisk, trotting footstep. The horses greet it with low, snuffling whinnies. The next moment the top of the door is thrown back, letting in a flood of light, and a man walks in. He is a little old man, clad in a white linen jacket and corduroys. His first act is to go up to each horse in turn and pat each head and firm strong shoulder; then he goes and leans his arms on the half-door and looks out for a moment or two. His withered face is so brown and wrinkled that it is like a walnut shell; he has a pinched nose, a pursed-up mouth, and small bright dark eyes. His whole expression is keen, honest, and obstinate.

There has been rain in the night, and the thick moss on the barn-roof is vividly green. Long

bright drops drip from the thatch; on the top of the cowhouse, a flock of sparrows are chattering and quarrelling; a long line of ducks march through the rickyard, stopping occasionally to paddle about in a puddle or dive their bills into a pea or bean rick. The old purple-breasted drake leads the way; his bright green glistening head is as brilliant as the wet moss on the barn-roof. They waddle off down the quiet road to the pond. How cool and greenly translucent the pond looks in the early morning light! The nut-boughs hang over it, and once in a while a nut slips its tawny husk and drops with a gentle splash into the water; or a yellow leaf floats down, and settles so softly as to cause scarce a ripple. There is a dragon-fly skimming across it, with a rustle and flash of glittering colours, a wonderful gleam of copper and purple, of emerald and turquoise. At sight of the cool green water, the ducks all rush forward, flapping their wings; then pause, when they have waded half in, to drink as greedily as though they had not stopped at every puddle on the way! There is no more still reflection for the little pond; the ducks splash and dive from one end to the other, till Daniel—or Dannel, as he is always called—the carter comes down with the horses and sends them quacking away. The horses hurry forward—Diamond, the old black mare, going in till the water laps against her deep strong chest. For a minute or two they stand drinking, drinking a long fill; then they slowly and reluctantly get out of the pond again. Doctor, the great brown, by virtue of his age and sobriety, is allowed to go without a halter. How he revels in this little bit of freedom! Stopping to eat a bit of the emerald grass growing along the gutter that flows from the pond, pulling a mouthful out of the hedge, going to look over a gate, and then coming along with a leisurely and independent gait, paying no attention to Dannel's shouts of, 'Hoot! Doctor!' as he stands holding the yard-gate open. The farmyard is all awake now; the cows are being driven into the milking-house, with a great deal of barking and excitement on the part of the rough old sheep-dog. A man is leaning against the stable wall, talking to the cowboy; he is a new-comer, just engaged as 'carter's mate.'

'What sort of a old chap be he?' he inquired as Dannel came in at the gate.

'Oh! he be middling enough, but a bit queerish; he can't abide the women!'

'Why's that?'

'Ah! he'll tell you that himself, sure enough; he be ter'ble fond of talking of it!' answered the boy, moving off, to allow the horses to enter the stable.

'Good-mornin', mate,' said Dannel civilly. 'If you'll come along o' me, I'll show you which be the horses.—This be Punch,' pointing to the roan at the beginning of the stable; 'and that next he be Poppet, and V'let, and Black Di'mond; and this here be Doctor. I'll warrant he be a good hoss, that he be,' said Dannel, passing his hand proudly over Doctor's shining flank. 'Treat un kind and he'll do anything fur you; but if you offers to hit un, he'll go through hedge w' you! That be all; and I'll be bothered if you could see a purtier lot anywheres! And now, I 'lows we'd better begin feedin' on 'em.'

There was a rope-ladder in one corner, leading

to the loft above, which Dannel ascended; and a moment or two after, a quantity of clover came tumbling into the rack above the horses' heads. When they had finished eating, the two men began to harness them. As they went out of the yard, Dannel glanced round and said: 'You be holdin' your whip wrong; you must hold un' as I holds mine!'

Jim shifted his whip with a half-smile, and they went on in silence till the field was reached. The sky was stormy; huge masses of cloud hung heavily, casting great purple shadows on the hills; the blue showed here and there between the clouds, and the sun shone fitfully. At this time of year everything has a softened look; most of the pale stubble-fields are yet unploughed; the trees are toned down with buff and brown tints; there is a haziness over the distance; and the hedges are gray with wild clematis; while a white dew lies over the grass. The flowers are gone, save where a dandelion still lingers, or a campion a little deeper pink than its sister-flower of the summer, or the tiny weed-flowers that creep about the fallows.

The two men harnessed the horses to the harrows and began to lead them up and down the field; another man and a boy joined them, and collecting the couch into heaps, set fire to it. A flock of sea-gulls came flying inland with a whiteness on their wings as of beaten silver.

'I'll warrant we be goin' to hae stormy weather, you,' said Dannel with a wave of his whip at them. 'When you sees they playgull gulls a-comin' in, you may be sure 'tis goin' to be rough.'

'Ah! And I seed the old sow a-carryin' about straw to make her a bed,' said Jim.

'There be a many ways o' tellin' what the weather be goin' to be,' said Dannel; 'but what you can goo by more nor anything, be they little red bird's-eye flowers; they shuts up so tight when rain be a-comin', I've often a said to my mate: "It be goin' to rain; they bird's-eyes a-shutting up;" and sure enough there'd be rain afore long; and then, when it be over, they'll open again, and look so innocent!'

'The moon looked queer last night; I thot we war goin' to hae a change,' said Jim; 'he was late last night.'

'Ah! he be allus three-quarter o' an hour later every night till he comes to the full.'

'Aw! I didn't know that; I thot he warn't particular whether he gained or lost, till he come to the full.'

'Yes; three-quarter; you ask anybody, he'll tell you that.'

There being no wind to blow the smoke from the couch-fire away, it hung white over the field. It was very still; the only sounds besides the rattling of the harrows were the voices of some children blackberrying in the distance, and tinkling of a sheep-bell from some sheep turned out in the fallow.

'Tis time we knocked off and had our dew-bit,' said Dannel at last, leading the horses off to the hedge; where the two men sat down and brought out their breakfasts, while the horses munched contentedly away at the hedge.

'Rev you bin here long?' inquired Jim presently.

'Forty-five years, man and boy. I come here

cowboy; then milkman; then carter's mate; then carter, same as I be now.'

'How come you to turn carter, if you began milkman?'

'There was an 'oman in that,' growled Dannel. 'Drat 'em, they be in everything!'

'What she got to do wi' it?'

'Why, 'twas like this yere,' said Dannel, settling himself as though for a long tale. 'There was me and a dairymaid—the finest-lookin' maid ever I set eyes upon! I can see her now as plain as I can you—a half-wistful expression came over the old man's face—'wi' her eyes as black as kickseys [sloes], and her cheeks like car-nations; but her heart was as hard as a Isle o' Wight cheese—that it were! And I was a gurt chap, halfways betwixt eighteen and nineteen. Half-past five I got up and got the cows in. There was six for she to milk, and six for me; but she'd be off every mornin' a-courtin' her spark—so I heerd arterwards—and left me to do 'em all! I thought I was keepin' company wi' she all the time, you sees! Lor, lor, lor! what a foolish errant she did send me on! He was carter's mate here, same as you be now; and one fine day off they went and got married! Dear, dear, dear, how the folks did laugh. I felt like a snail wi'out are a shell. But wold maister, he said they hadn't a treated me well sarvin' me so; and he didn't think much of him best o' times; so he gived 'em both the sack, and put me on in his place, fur I wouldn't hae nothin' more to do wi' milkin'; I was that soured, I'd hae turned the milk!'

'Be that why you be a single man?' inquired Jim.

'Yes, 'tis. If a hoss kicks me once, I'll warrant I don't go anearst his heels again in a hurry!'

Jim took a long pull at his tin bottle of tea, and said: 'Coz one 'oman med a fool o' you, weren't no call to think all on 'em would. Now, there be my missis; I don't know what I should do without she!'

'All I've a got to say be that there baint no trust to be put in 'em,' said Dannel doggedly. 'They be like a shyin' hoss—you never be sure on 'em. They've a hand in all the trouble as ever comes into the world.—Ah! I often thinks o' that young hussy Eve, when I be out in the fields a-harvestin' and a hay-makin' wi' the sun pourin' down fitten to melt you! 'Twas all along o' she as we've got to arn our bread by the sweat o' our brows!'

The sun came out as the day wore on, shining on the mellow tints of the hedge, where the maples had turned yellow, and the bracken russet. Sometimes a cart would pass along the road, and its driver shout a remark to Dannel, who would at once give Jim a long account of him, his family, past history, and place of abode.

When the other men went home to dinner, Dannel went up to the farmhouse, and presently reappeared with a large junk of bread, some cold pork, and potatoes. He sat down on a heap of straw in one corner of the stable and slowly consumed his dinner. The big black stable cat came purring round to share it. Dannel slept at the farmhouse, and was supposed to have his meals there; but he always preferred to take them away with him either into the fields or the

stable. When his dinner was finished, he lay back on the straw and had a peaceful nap till Jim came back again. As they were reharnessing the horses, there came a crowing, chuckling sound, and a little girl of about two years appeared. She stood laughing, and putting her small round head, which was covered with scant yellow hair like spun-silk, round the door as she peeped up at Dannel and called, 'Yannel! Yannel!'

The old man's face completely changed—it became positively illumined. 'Well, my dove, and what do you want?' he asked in the most blandishing tones his rough voice could take.—She toddled off towards Doctor.—'You wants a ride on Doctor, that's what you wants. Well, you must give wold Dannel a kiss fust!'—She at once laid her soft cheek against his hard brown face.—'You be artful, you be,' he said beamingly. Then he lifted her on to Doctor's great back and held her there.

'Who be she?' asked Jim.

'Oh! the little un up at the farm,' replied Dannel.

At this moment a sharp-faced, bright-looking, elderly woman appeared hurriedly. 'There—I knew she'd be here,' said she. 'Directly my back be turned, that bad maid be off to stable!'

'And why shouldn't she, if she've a mind to it?' said Dannel in a surly voice. 'Where you'd allus be off to, if you'd your way, would be to shop, a-squanderin' your wage on finery, makin' yourself look like a old sheep in lamb's guise.' He looked at her with a chilly and distrustful expression as he spoke. Dannel always was oppressed by a fear that every unmarried woman who came near him wanted to marry him.

'Be you going to keep that child here all day?' inquired Sarah blandly.

'Run away now, my lovey,' said Dannel, dropping his voice to a softly amiable tone again. 'And to-morrow, I'll take you out in cart.'

The baby went off, holding Sarah's hand, but still turning to gaze back at Dannel.

'I never know'd nothin' so knowin' as that maid be,' said he, watching her admiringly. 'She took to me from the first, that she did! I'll warrant I could stop her cryin' when nobody else could, when she war a little tiny baby!'

'I wonders you'll hae anything to do wi' she, considering as she'll be an 'oman one o' these days,' said Jim with a twinkle.

'Ah! but my maid be goin' to be worth the whole lot o' 'em boiled down!' said Dannel with conviction, leading the horses out of the stable as he spoke.

'His maid' was the only person to whom he ever unbent; she was the only one he never snubbed or snapped at. She always rode in the cart when he went to cut fodder for the horses, returning on the top of a load of sweet-smelling clover; or in winter, when he went for turnips or straw, she sat in the front of the cart carefully wrapped up in his coat. On Sundays he hung about round the kitchen door till she came out, when he would take her 'a-flowerin'' when the summer grass had grown long and golden with buttercups; or a 'bird's-nestying' in the spring, to see the horses when they were tethered out, or the cows milked. There was always something new and delightful.

Gray clouds were blowing up from the south

across a stormy yellow, when the last weeds were cleared off the harrows and put on the fire; there was a dull fiery red where the sun had just set, but opposite was a bit of clear pale blue sky with one quiet star. The reflection of the sunset sky cast a subdued light down one side of Dannel and the horses, as they went through the dark field beneath. In the distance, blowing up a great cloud of white smoke against the dark hills, was the couch-fire. Jim stayed to give it a final stir with his preng till it flashed up so red a flare that the paling glory of the sunset, the little white star, and everything round, seemed to go dark in a moment.

The stable was dark when they reached it.

'I must go up and get some caudles fur my lantern,' said Dannel.

There was a pleasant smell of new-baked bread filling the kitchen as he entered it, for Sarah was just pulling the hot loaves out of the oven.

'There's your tea ready for you over there,' she said, pointing to the dresser; 'but you'd better stop and have it by the fire, for it's a bit chillish out this evening.'

'No, thank ye,' said Dannel suspiciously. 'I'll take it with me. What I be come for be some caudles.'

Sarah reached up to the high mantel-piece for the candles, and in doing so, knocked off a candlestick and bent it. She picked it up and tried to straighten it.

'Here; give it to me,' said Dannel, taking it and putting it straight. 'Dear! how helpless the women be!'

'You're that conceited, Dannel, I've no patience with ye,' said Sarah, ruffled. 'I'll warrant there baint many things as you can do as I couldn't, if I tried.'

'Can ye sow?' asked Dannel with great contempt; 'or thatch, or mow, or plough?'

'I dessay I could if I tried to it,' replied Sarah undauntedly; 'and I've a sowed beans, and thatched our bee-hives; and I'll tell you what I've a done'—

'Your words, Sairey, comes out as fast as the chaff do when we be a-threshin', and wi' about as much sense in 'em as the chaff have grain.'

'There's good grain comes out, too, Dannel, when you be threshin'.'

'If there be any grain in the women's talk, I'll warrant it be mowburnt, and nothin' ever comes o' it!'

'If no good comes o' our words, 'tis because the men's minds, Dannel, be but bare and stony ground for 'em to fall on!'

Dannel could think of no retort to this, so he went off, saying: 'Dear! dear! how the women do talk!'

'Don't forget to bring some caudles for me, if you goes into town to-morrow,' called Sarah after him.

'Yes,' replied Dannel grumpily, and departed.

In spite of his dislike to 'the women,' Dannel never forgot any of the numerous commissions they gave him to do when he went into the market-town. He always put a series of knots in his great blue-spotted handkerchief; and when he got into the shop, he would draw it out and go through the different knots in an under-tone: 'This yere be the meat fur to-morrow's dinner; and this two reels of machinery cotton black;

and wicks fur the lamps; and a penny o' cough drops; and— Oh yes! this be it; this little titty tiny un at the end o' it!—Three pounds o' tea if—you—plaze!

On one occasion a rather eccentric aunt of the master's, staying at the farm, told him to go and order her a bonnet. 'And tell them, Dannel, it's to be a plain one!'

Dannel was just starting with a load of straw to the town. He looked rather sour, but said nothing. When he reached the millinery establishment, he drew the team up outside it. It was a snowy day, and he had his long greatcoat on, faded, by years of exposure, to a dull greenish brown. It was powdered white over the shoulders with snow. In one hand he held his big brass-mounted whip. He opened the door and walked sturdily in. 'You be to make Miss Dixey a bonnet,' he said in his strong rough voice; 'and you mind this—you baint to put none o' they cockelorum jigs on to it!' Having said this, he walked out of the shop, waved his whip to the team, and went on with his load of straw. The bonnet arrived in due course, and proved satisfactory!

He was a strange, obstinate, crusty, old man, living a solitary life, out in the fields all day, always in company with the horses, till such an understanding grew up between him and them that they knew every wave of his hand or whip, every tone of his voice. He took a wonderful pride in them; and in the evenings, when the other men went home, he would stay in the stable grooming them and plaiting their manes and tails with straw and ribbons. In the winter, when the wind was blowing in freezingly under the door, and the long icicles hung from the thatch, sparkling in the frosty white light of the moon, and the horses' hair was all ruffled up with the cold, he would be driven up to the house, where he would sit over the brewhouse fire reading his Bible by the light of his lantern. He always read aloud in a loud monotonous chant, raising his voice still higher if 'the missis' or Sarah came in, and choosing such parts as he thought at all applicable, such as, 'Let your women keep silence in the churches;' 'and everywhere else, says I!'

But one evening the 'little maid,' playing round the kitchen table, fell on the hard stone floor and cut her hand. She began to wail and cry pitifully, and a moment after, Dannel's head was thrust round the kitchen door. 'What's the matter with Polly?' he asked with an angry glance at Sarah.

'You needn't look at me like that!' she said indignantly. 'I han't done nothing to her. She fell down.'

Polly held out a small chubby hand with a bleeding palm to him.

'Wait a moment, my little maid, and I'll soon cure that,' said he, hurrying off to the stable, and reappearing with a large cobweb, which he wrapped round the wounded hand. The novelty of this so pleased Polly, that she stopped crying, and began to laugh, though the tears were still trickling down her cheeks.

'Got any picture-book, Sarey?' asked Dannel, picking Polly up, and carrying her off to the chimney corner.

Sarah produced a battered volume from the

table drawer; and Dannel turned over the pages and explained the pictures, till Polly becoming sleepy, Sarah carried her off to bed.

After that, Dannel often came into the kitchen of an evening, and would sit in the chimney corner and tell Polly stories of the different horses he had had under his charge, and of his own experiences as a little boy 'minding' the rooks. He was always very civil to Sarah on her own ground, and on one occasion he even went so far as to pay her a compliment. She had just been cleaning the kitchen, and the floor was snow-white, save where it took rosy tints in front of the blazing fire. The dresser had been polished till it shone again; the coppers under it twinkled with brightness. Dannel cast an admiring glance back at it, as he was preparing to depart, and said: 'The kitchen looks proper, Sairey! I 'lows you knows how to get round the table!'

Sarah was silent with astonishment for some time after; then she said: 'Well, there! I declare Dannel be like a Ribstone apple, he improves with keeping!'

DESERTED.

Will you remember, when, at close of day,
The crimson sun in alien skies is burning,
The eyes that see his rising far away,
Eyes dim with their long watch for your returning?

Will you remember, when, at last, at last,
These weary eyes are closed in dreamless sleeping,
How they would brighten for you in the past
Ere their long night of watching and of weeping?

Will you, perchance, when many days are over,
Come back, with broken heart, to die alone,
Find the old places, but no friend, no lover,
No home where once you knew them all your own?

Ah, then you will remember, sad and old,
This heart which loved you, and which you have broken—

The heart which would have blessed you and consoled,
And all the tender words I would have spoken.

You will remember then, and, slowly burning,
Old memories shall eat into your heart,
Of all my passionate hope, my hopeless yearning,
Surely at last you too shall bear your part.

Oh, I could curse you—if I did not love you!
You, who have made my life a heaven, a hell.
I hate that passionless sun that shone above you,
Yet—for he looked on you—I love him well.

THE FIRST ORATORIO.

By J. F. ROWBOTHAM, Author of *The History of Music*.

A PERSON visiting the Crystal Palace on the occasion of a Handel Festival, and observing the four thousand singers crowding in multitudinous throngs the orchestra, the five hundred instrumentalists ranged in a portentous band beneath them, and finally the great organ, reared like some huge mystic superstructure behind—beholding all this array of voices and instruments, and then suddenly hearing them pour fourth a stentorian chorus from the 'Messiah' or 'Israel in Egypt,' which rolls in vast and endless volume through the enormous building—a visitor to this scene for the first time could not but be struck, nay, overwhelmed by the mightiness of the spectacle and the harmonious magnitude of the sound, which he saw and heard before him, and might well be tempted to ask, What sort of thing was the First Oratorio, from which this is so stupendous a development? From what quaint and forgotten source did this mighty river proceed, whose waves now beat before me?

The answer to such a question is one not only likely to interest every lover of music, but every cultivated mind. Oratorios have been and are so popular amongst us, that we naturally have the same interest in them as in any other product of man's creative genius, which attracts attention and compels admiration.

In the first place, we may well imagine that if we could have travelled back a century or more in fancy to the time of Handel himself, or a little later, we should have seen a very different spectacle on the platform. The crowds of tenors and basses now arrayed in faultless dress clothes or garbed in the more common morning attire of to-day, would be replaced by men in full-bottomed wigs, reeking with powder, in bright red or green coats and knee-breeches, and wearing swords by their sides. The ladies would have worn powdered hair, patches, and furbelows. Already we are in strange proximities, and the oratorio as

seen in the reign of George III. looks very different from what we are accustomed to behold in it to-day.

But if we were to go back further still, we should find the singers not content with sitting and standing as they sang or were silent; but instead thereof, setting appropriate actions to their words, and endeavouring to depict by their gestures, and even by their dress, the sufferings of some persecuted apostle, the passion of some saintly martyr, or whoever else were the hero of the sacred drama.

The oratorio as we see it and know it is a spectacle deprived of all its romance, a drama divested of its acting, a piece of musical elocution bereaved of all the help which scenic display and appropriate dresses could afford the singers to portray the action which they are describing.

Like all developed things which are in the world around us, the oratorio has had a long history, and only by slow and laborious degrees has it attained its present pitch of perfection. If we would seek the source whence it came, we must turn back to the Mystery Plays of the middle ages. Out of this apparently so unpromising source the oratorio arose. Mystery plays used constantly to be provided with musical interludes and occasional songs, with which the characters relieved the monotony of their declamation. And this appendage of music to the sacred plays first suggested the possibility of applying it constantly to the development of the action.

The clergy finding people appreciate the stories out of the Bible, when they were enacted on the platforms of the mystery theatres, tried the experiment of introducing these performances into their churches. The first of the kind that we read of in medieval chronicles was the drama of the 'Ass,' which belongs to the twelfth century. It was played in church on the fourteenth of January every year. A beautiful girl was selected as the heroine of this strange drama, and she was seated on an ass, most elegantly caparisoned. She was intended to represent the Virgin Mary; and in order to make the resem-

blance the more complete, a young baby was placed in her arms, who was designed to represent the infant Jesus. In this guise she was led up the church, and dismounted at the altar, while the ass was tethered by her. The chancel, or part of it, was turned for the time being into the representation of a manger, and while the ceremony we have described was going on, the choir sang a long hymn or song descriptive of the ass and its mistress.

Not in one or two churches only, but in nearly every church in Europe was this strange little drama presented to the view of the congregation once a year; and in learning to admire and take an interest in this musical spectacle, our ancestors were learning their first lesson towards appreciating the oratorio.

From so simple a form as the above, the idea grew to more elaborate proportions. The story of the Conversion of St Paul—the very same subject which attracted the genius of Mendelssohn in the middle of this century—was sung with appropriate action at Rome four hundred years before. One singer represented the apostle, others enacted the parts of his companions. They moved along the church, when suddenly a flashing light was shown through the roof, and the singer fell down as if blind. The voice from the clouds was represented by a concealed choir, much in the manner wherein Mendelssohn elected to represent it. The journey to Ananias was then portrayed; and the whole was accompanied by strains of music, which were a mixture of snatches of the church service and of popular airs of the day—not a very promising combination for the prospects of future art.

The story of Abraham and Sarah was similarly represented at Florence a few years later; and this story seems to have been an especial favourite with the promoters of that sort of entertainments, since in the notices which chroniclers furnish us of these musical exhibitions, Abraham and Sarah occurs twice or thrice as often as any other religious drama.

But yet this was not oratorio proper, nor can the actual musical form be said to have begun until a considerably later period, when in a very singular way, and from an unexpected quarter, the first great impetus was given to the culmination of all these tendencies in a definite oratorio.

Among the great preachers of Rome, the most popular of his day was St Philip Neri. The eloquence of his sermons, the fervour of his religious zeal, the austerity of his life—all combined to increase his reputation for holiness and draw crowds to his church. Unlike many of the ecclesiastics of his day, he approved of all means of winning people to a religious life, and attracting them to church. He held that the end justifies the means; and among the most potent auxiliaries to the cause of proselytism was, he thought, good music. Accordingly, he introduced the

short sacred dramas we have spoken of as a regular adjunct to his services.

It was his custom to hold evening services in his church every day, for the purpose of giving the shopmen and labourers of Rome an opportunity of attending, which otherwise they would have been unable to do. The musical drama was divided into so many acts, and between each act the eloquent ecclesiastic preached a short sermon, commenting on that portion of the story which had just been represented, and explaining anything in it which seemed to require explanation. Great care was taken in rehearsing the dramas, and willing volunteers were found for the work, furnished with excellent voices, and sufficient skilled musicians to perform their parts with spirit and correctness.

So popular did these religious plays become, along with the services which accompanied them, that people flocked from all parts of Rome to hear them; and the good pastor had the pleasure of seeing many worldly people of fashion become 'very good Christians, by constantly attending the evening services and going through the form of prayers, until at last they became partakers of the spirit.'

Occasionally he varied the religious drama by substituting a number of hymns; but this was by no means such a popular method of proceeding. The people liked the scenery, the dresses, the action, the stage—for there was a stage in the chancel, on which the action of the drama proceeded—and declared that there was no church like St Philip Neri's for learning to understand the Scriptures, and reaping all the profit from them which they were capable of conceding. The church of St Philip Neri was called St Mary's in Vallicella, and the portion of the edifice where the plays were held was called the Oratory. From this reason the musical dramas began to be called 'the plays of the Oratory' or 'Oratorios'—a name which they have since retained.

For the purpose of furnishing a direct source of lineage to the modern oratorio, it was necessary, however, that the purely religious part of the service should be eliminated, and that only the musical and dramatic element should remain. This was not possible during St Philip Neri's life. His eloquence was so great and convincing that people would by no means hear of a divorce between the sermon and the drama. The two things remained in combination, and were found to be the most charming form of worship and amusement to be obtained in Rome.

But Neri died, and the performances were continued without any of his irresistible eloquence to recommend them to the public. What, then, was wanted was a more careful elaboration of the plot and a greater and fuller attention to the music. Emilio del Cavaliere, a famous musician of the day—it was in the year 1600—has the credit of applying these two desiderata to the musico-religious form of drama which St Philip Neri had introduced; and by this means

Emilio has gained the title of being 'the Father of the Oratorio.'

'The First Oratorio,' in the real and perfect sense of the word, was performed in St Philip Neri's Oratory shortly after the death of that celebrated preacher, and its joint-authors were a lady named Laura Guidiccioni, who wrote the words, and Emilio del Cavaliere, who composed the music. It was entitled 'The Representation of the Soul and the Body,' and was in a great degree allegorical in its spirit. The characters, which were enacted by Roman youths, were Time, Life, Pleasure, the Intellect, the Soul, and the Body. The dresses for these strange *dramatis personæ* were devised on the same lines of fancy which we indulge at the present day, when a lady goes to a fancy dress ball as 'Night' or 'Winter,' and may be easily conjectured without our pausing to describe them.

In addition to the principal characters there was a large chorus, which was responsible for the choral elements in the action and the music; and over and above the chorus the careful composer of the oratorio has recorded with patient minuteness the necessity of two youths among the characters who might declaim the musical prologue. To accompany the songs of these various performers there was a small orchestra, consisting of a harpsichord, a 'double lyre,' which we may perhaps identify with a viol da gamba or 'violoncello,' a large or double guitar, and two flutes. The orchestra is oddly composed and strangely balanced. A modern musician will be apt to ask, Where are the violins? There is no part written for the violin in Emilio's score, but he has added the quaint suggestion that the soprano part of the music could be greatly improved if a violin were to play in unison with the voice throughout. The monotony which would arise from such an arrangement does not seem to have struck him. His orchestra was carefully hidden from view; and in the excessive solicitude for their concealment Wagnerians may recognise an anticipation of Wagner's similar precautions. The Baireuth master required his orchestra to be hidden, in order that they might offer no interruption between the real and the ideal—the real was represented by the spectators in the house, and the ideal was denoted by the imaginative drama on the stage. We know not if Emilio del Cavaliere had so abstruse and fanciful a theory for the concealment of his orchestra. At any rate, he was as careful of the fact as Wagner was in the expression of the theory.

In lieu of a visible orchestra, he made another suggestion, which Wagner in one at least of his operas has likewise initiated and acted upon. In 'Tannhäuser' we all remember that the minstrels make great play with their harps, and the sense of reality is greatly heightened by the fact of our perceiving music to be made by actual instruments on the stage, instead of merely resounding from the invisible swell of sound pouring from the orchestra. The Father of the Oratorio has made a suggestion still more realistic than any occasional introduction such as the above. He recommends that all the characters in the oratorio should, wherever possible, carry their own instruments in their hands, and pretend to play their own accompaniments directly the music strikes up. Old Father Time

was thus to be furnished with a lyre; Pleasure, with a guitar; and the other characters with instruments adapted to their nature; and the whole of the *dramatis personæ* were to be, at least in appearance, musicians. We do not know if this requirement of Emilio's was carried out entirely as he desired it; we rather suspect that the managers of entertainments in those days were as ruthless as they are at present, and cut down the schemes of composers directly they exceeded the bounds of the *sine quâ non*.

An overture to the oratorio was first performed; but in place of an instrumental overture as at present, the prelude was delivered by a chorus, and was, in fact, a madrigal, although it received a more dignified name. The curtain then rose, and the two youths, specially designed for the office in the list of characters, delivered the prologue. At the conclusion of this, Father Time came on the stage and performed a long and elaborate solo. When his aria was finished, the Body made its appearance, and in the midst of an impassioned declamation threw away its golden collar and the feathers from its hat, presumably, we suppose, to indicate that it would have no more to do with worldly vanities.

The World and Life were then to have a duet, and, like the Body, were gradually to divest themselves of their gay and gaudy attire, until at last they were merely clad in rags, 'very wretched, and ultimately dead bodies.' The general idea of the piece, as may be gathered from this, was to show the transitory nature of all worldly grandeur, and its nothingness in comparison with the higher things of the soul.

But what must ever amaze us in the account of this 'First Oratorio,' is to discover that at certain points in the action all the characters joined in a dance. The fact of the performance taking place in a church does not seem to have suggested that there was anything incongruous in a dance. At any rate, not only did the spectators welcome the dances as a very essential addition to the entertainment, but the composer himself was very careful to denote the various kinds of dances which might be employed. He suggests the Galliard, the Courante, and one or two more, and recommends the four principal singers to 'embellish their dancing with capers.'

At first sight, we might imagine that the introduction of the dances was only occasional throughout the oratorio, but there is good ground for believing that at the end of every verse the singer performed a dance on the stage, during the instrumental interlude which separated one verse from the other. Let us imagine Mr Edward Lloyd giving his hand to Madame Patey at the conclusion of every section of his solo, and turning her gracefully round the platform before he commenced a new one, and we shall have a fair idea of the extraordinary nature of the entertainment, which at that time attracted the admiration of all Rome.

From this humble beginning, and by constant improvement, and abridgment of the elements of bad taste in the old form, the oratorio grew and developed to the chaste, sober, and magnificent interpreter of the religious impulse which we know it to be at present. But at first it was the quaint and almost ridiculous entertainment which we have just described. And those

who also admire its greatest achievement to-day, would hardly recognise the relationship between our nineteenth-century displays and 'The First Oratorio.'

POMONA.*

By the Author of *Laddie, Tip Cat, Lil, &c.*

CHAPTER XV.

Glad and well aware
Of the most genial brightness, as a tree
Expands its leaves to meet the noontide glare,
So basks she in love's light contentedly.

EMMA RHODES.

'HER ladyship's love, Miss, and she would be glad if you could go to her room.'

Mona Lester had just come in from her morning ride in the Row. It was a beautiful morning, early in May, and the Park looked green and bright, and the horse chestnuts were lighting up their tapers pink and white, and the laburnum's golden chains tossed in the fresh, little breeze which ruffled the glowing bravery of the lilacs.

Mona had had a very pleasant ride. The day was fresh and exhilarating; her new little chestnut mare was all that heart could desire, with a skin like satin, and a mouth like velvet, which, by the way, are contemptible similes, as most of the similes we use about nature are, for 'Solomon in all his glory was not arrayed like one of these.' Mona looked, as most girls do, her very best on horseback; and without any vanity, or as little as human nature is capable of, there is a satisfaction in appearing to advantage. She had met a good many people she knew, and among them the Mr Moore she had met at dinner at Mrs Cuppleston's, and who had told her about Mr Ludlow and the picture. She had stopped some time talking to him; he was very pleasant, and she thought she liked him better than most of the men she had come across lately. He was not quite so much of the one uniform pattern; and he was certainly very good-looking. She would get mother to send him a card for their next 'at home.'

She was thinking this as, in consequence of the servant's message, she went, before changing her habit, to Lady Lester's room and softly opened the door. The room of an invalid, with light and temperature and sound and scent all subdued and softened down, and deprived of the pleasant inequalities and variations of healthy, every-day life; no sunshine or brisk breeze, or shrill birds singing, or wholesome smell of fresh-turned earth or salt-sea breath. The worn shadowy face that raised itself from the pillows as Mona entered, looked as if any sudden shock might take the feeble life out of it in a moment; and the pale hand that stretched towards her looked as if it had no strength even for that slight effort, but dropped to her side before Mona had crossed the room. No contrast could have been greater than that between the mother and daughter, who came in like a very incarnation of health and youth and life and energy.

'Dearest,' she said, 'you are not so well this morning?'

'There is nothing much the matter,' the weak

voice answered; 'only Dr Craddock has been here, and he has been urging me to go down to Beechfield with as little delay as possible.'

'Oh, mother, let us go!'

'Yes, that is just it.' There was the slightly fretful tone of an invalid perceptible in the soft persuasive voice. 'I knew you would say so; and I will not go if it means dragging you away from London at the very beginning of the season.'

'There is no dragging about it.' Pomona had tossed off her hat, and sat down on a low stool by her mother's sofa, where the invalid's hand could smooth the soft plaits or stroke the blossom-tinted cheek.

'I know that, my darling; but it will make me feel wretched and selfish if I let you do so. I want you to agree to my going down with Morris, and Lady Charter is coming up and taking my place. She is longing to come to town, and she knows all our set; and you like her, and she is very fond of you. You can run down for a day now and then, to cheer me up when there's nothing very delightful going on, or there's any engagement you want to get out of. Yes; I know it will spoil it all. I like to think that half the pleasure is sharing it with me; and it's mere selfishness on my part to make you stay, for I want to have a description of everything that goes on.'

'Mother, let me come!' Lady Lester's tired eyes closed wearily. 'You know I am perfectly happy at Beechfield. It will be lovely there now, and the nightingales singing, and the limes full of primroses; and I can drive you out with Tom and Jerry; and I have seen a lovely, little carriage that does not shake an atom—and every one would be away, and we should be all to ourselves. It would be a sort of honeymoon; and I would do everything for you instead of Morris, and sleep in your room.—Oh mother, let me come!'

She could not tell how alluring the prospect was to Lady Lester to have her darling all to herself. Though Pomona was her only one, it was quite curious how little she had had her to herself. Even as a baby, grand nurses and nursery regulations had come between them. She remembered how she used to envy the cottage mothers rocking their sunburnt babies to sleep at their open doors, or even gypsy tramps with little black-eyed babies tied on their shoulders, who could turn and kiss the dirty, little face nestling against their neck at any moment of the dreary day. Later on, education had interfered. All the most elaborate modern machinery of education must be brought to bear on the child. Lady Lester's friends said she had education on the brain; even the holidays were pervaded by the presence of holiday governesses. If it was not education, it was health, which is perhaps in these days a more important consideration than any other. In our modern Pantheon, the goddess Hygieia is the one who has the greatest number of worshippers, and at her bidding, people submit to banishment and torture, and live hard lives of self-denial and asceticism, such as they would hardly endure for any other cause. So it happened that perhaps at the very moment when Lady Lester and her little girl might have been happy together, the

mother would fancy that the child looked pale or languid, or was beginning to stoop, and she would be sent off to the seaside or to more bracing air away from home.

Then, when education was finished, and Pomona had grown as fair an example of beautiful health as heart could desire, society stepped in, and society is the greatest tyrant of all, who, though she does not exact such painful sacrifices as health, is a harder taskmaster than ever Pharaoh was, and keeps her slaves working night and day on the treadmill that we call pleasure.

And through the ceaseless round of society loomed the certain prospect of Pomona's marriage, which would separate them finally. Of course she would marry—of course Lady Lester wished her to do so, though her very heart bled at the idea. Already many times during the two years since she came out, this suicidal wish seemed likely to be realised. Pomona was much admired, and her large fortune showed off her attractions to the greatest advantage; but hitherto the girl had remained heart-whole, and had declined offers which most girls would have thought irresistible.

She enjoyed her life immensely; the admiration and homage she received was very gratifying to her; but it was quite as gratifying from one man as another; and directly it became too demonstrative, it grew tiresome.

'I wish they wouldn't!' she said one day, with the letter of one of her suitors in her hand. 'I liked this Captain Lupton so much, so very much. He danced perfectly, and was so amusing. Why couldn't he have been satisfied with dancing and talking? And now there is an end of it all.—I think I am too much in love with you, mother, the girl would say; 'I don't want any lover but you!' And Lady Lester, looking at the lovely face, could not be surprised that Captain Lupton and the others could not be satisfied.

But now Lady Lester would not be persuaded to gratify herself to her heart's content with this true love, and leave the noisy rattle and glare of London for the lovely quiet of Beechfield, where the tender green buds were opening, and the hawthorn snow covering the hedges, and the blue-bells in the coverts mimicking the sky, and the nightingale's long note softly touching the silence.

'You must not vex me, my darling,' she said, stroking with a caressing hand the soft cheek. 'I am one of those tyrannical invalids that must not be crossed, Dr Craddock says. I must not be worried, and it will worry me constantly if I think I am taking you away. I want you to help me, not to make it harder for me. I have seen Parry, and he is going to make all the arrangements for my going down this afternoon. It is a fine day, and I am pretty well; and I may not be so fit for the journey to-morrow; but I am a little bit tired now, and must rest.—But before you go, there is something I want to tell you, and something I want you to do, which I meant to do myself while we were in London; but I have not been well enough to see to it.'

'Don't trouble about it now, mother dear,' Mona said. She was sore and sad at her mother's decision, and a little bit hurt, though she would not show it, at its having been decided before telling her; and she feared that Dr Craddock

must think badly of her mother, to insist on her going home so immediately.

'I want to tell you now. It has been very much on my mind lately, especially these nights when I sleep so badly. There is a relation of yours, father's. I think it is a girl, but I am not sure. But I think she must be about your age.'

'One of the Lesters?'

'No. A sister of your father's married beneath her, and they were all very angry about it.'

'Oh! a sister of father's? Then she is my aunt?'

'She is dead; but there was a child. I never knew much of the mother. I think she was at my wedding; but when I went to visit old Lady Lester, this sister was not at home, and she never came to us.'

'Whom did she marry?'

'I think it was a doctor; but I forget. Sir John was dreadfully upset about it, unnecessarily so, I thought at the time. But he would not have her mentioned. She died a year after she married; and, I think, left a baby; but I was ill and unhappy just then myself, and selfishly taken up with my own affairs; so I never made any inquiries.'

'Did you say the daughter was about my age?'

'Yes; I fancy so.'

'Then it must have been just when I was born?'

'Yes; that year.'

'And you were unhappy?'

'Till I had you, my darling, not after that.'

'What was her name?'

'That I cannot recollect, even if I ever heard. But Mr Freestone, our lawyer, can tell us.'

'And what do you want me to do, dearest mother?'

'To find out about her, and be kind to her, for I cannot help thinking it is a girl. It has been very remiss in me to have let all these years go by without trying to find her; but at first it vexed your father to make any allusion to it; and then, never hearing anything of them, the whole matter seemed to pass away from my mind. It was very wrong of me; but, Mona, you will do your best to make up for my neglect. I have been thinking, too, that anything I have to leave should go to her. You will not want it, my darling; but if they are poor, it might be acceptable to them.—And when you have seen Mr Freestone, and found out about the girl, I shall get him to come down to Beechfield and add a codicil to my will.'

The girl's arms were round her mother's neck with the terror that is not confined only to the ignorant and superstitious, but comes to many at the thought of providing against the sad but certain emergency of death; for though setting the house in order does not hasten the coming of that solemn guest, it makes us listen for his chariot wheels.

So Pomona threw her young arms round Lady Lester's neck, entreating her not to talk of such things; there was plenty of time to think of it—years in which they might find out this young unknown cousin, and help and be kind to her.

'Give her as much as you like, but don't talk of leaving it to her.'

And then, with sudden remorse at the wan,

faint look in her mother's face, she laid her tenderly back on her pillows, dashing away the hot tears that had welled up, and smothering the impulsive words of love and protest against dreary anticipations on her lips.

'I will do just what you wish, dearest—only now you must rest and be quite quiet, if you are to be fit for the journey to Beechfield.'

THE HIGHER ATMOSPHERE.

On the 19th of September 1783, a sheep, a cock, and a duck were carried in a free balloon to a height of fifteen hundred feet. They reached the ground again without injury, except that the unfortunate rooster had his wing broken by a kick bestowed upon him by his four-footed companion during the excitement of embarkation. These were the first aerial voyagers.

The first human traveller through the air was M. François Pilâtre de Rozier, who gained the distinction, in the middle of the following month, by mounting in a free balloon. Although the honour of first using this new power in the cause of science must go to France, yet it was from experiments conducted in England that the most satisfactory results were obtained. In 1859 the British Association for the Advancement of Science met at Aberdeen, and appointed a Committee to organise the steps necessary for taking a series of experiments in the upper strata of the atmosphere by means of balloon ascents. Nothing, however, was done for two years, and then at Manchester the question was revived, and the splendid ascents by Messrs Glaisher and Coxwell were the result. Four of these took place from Wolverhampton, and during one of them the intrepid voyagers attained an elevation of over seven miles. This is the highest point that has been, or probably will be, reached. The explorers were rendered unconscious by the great cold and the extreme rarity of the air; and no doubt the thirty-seven thousand feet to which they ascended marks the approximate limit beyond which it is impossible for human beings to exist even during the short limit of a balloon voyage.

Man is especially adapted to dwell at the bottom of the great aerial ocean that envelops the earth. He is intended to support an atmospheric pressure of about fifteen pounds on the square inch, and the outward pressure from within is so arranged by nature that equilibrium is maintained. But if he chooses to reduce this normal pressure by climbing a high mountain, for example, bodily distress must follow. The outward pressure of the bodily fluids have then little save the skin to keep them in check, and this they break through where it is weakest, and distressing bleeding is the result. The lungs, though painfully distended, cannot obtain a sufficient supply of the life-giving oxygen, and the slightest bodily exertion is attended with pain and difficulty. From the necessity of this exertion, the balloonist is to a great extent exempt; but though he may husband his vital resources as carefully as possible, the probability is that no human being can ascend above the height reached by Messrs Glaisher and Coxwell, and live.

Modern science, however, by providing self-reg-

istering instruments that are but little removed from absolute perfection, precludes the necessity of any life-risk being incurred in ascertaining the temperature and pressure of that section of the higher atmosphere reachable by a balloon. By means of these and a specially constructed balloon, it has been found possible to obtain accurate information at the height of ten miles. To M. Hermite belongs the credit of the most recent explorations in this direction. A small balloon was constructed capable of carrying apparatus weighing some thirty-five or forty pounds. The material employed was triple gold-beater's skin highly varnished. Among the self-registering instruments which formed the freight of the balloon was a mechanism which distributed inquiry cards. It was hoped by means of these to trace exactly the course followed by the balloon in its aerial flight. This ingenious contrivance was worked by a fuse, which unfortunately died out when the rarer strata of air were encountered, no doubt through lack of oxygen.

When everything was ready, the captive balloon was released, and it immediately shot upwards with a velocity of eighty feet per second, and remained in sight for forty-five minutes. The lowest pressure registered was less than one-seventh of an atmosphere, and this would give an approximate elevation of over ten miles. The self-registering thermometer showed a minimum temperature of -51° Centigrade or 92° Fahrenheit below the freezing-point of water. At this time the balloon was just upon eight miles high. The self-registering barometer and thermometer now ceased to record, probably owing to the ink becoming frozen. When a further ascent of two miles had been made, they resumed duty, however, the direct heat of the sun having probably thawed the recording ink. The temperature rose to -21° Centigrade or 38° Fahrenheit lower than the freezing-point of water. This experiment confirms previous experience as to the alternation of layers of atmosphere of irregularly varying temperatures. It will thus be seen that there is little difficulty in obtaining reliable data as to atmospheric pressure and temperature up to a height of ten miles. The use of aluminium for the metallic portion of the instruments ensures that no superfluous weight shall be carried.

In the experiment we have described, the balloon and its freight weighed about fifty-five or sixty pounds, and everything was done to conduce to lightness without sacrificing strength. To obtain records at a height of fifteen or twenty miles is a problem which, though capable of solution, will entail an enormous expense. To begin with—the balloon, instead of being six yards in diameter, will have to be enormously larger, as also will the enclosing bamboo cage, if that method of protecting it is resorted to. All this means an increased weight, and of course reduces the advantage gained by increasing the magnitude of the balloon. At the same time, it is quite possible that the ever-increasing interest which is taken in the study of storms and weather problems may lead to observations being more frequently taken by balloons at moderate heights. Many students of weather-lore assert that the key to much that is puzzling in meteorological phenomena is to be found in the air-movements above the currents at the earth's surface. So that it is

possible that, along with the provision of high-level observatories, balloons may be requisitioned to a greater extent than they are at present in obtaining the data necessary to successful weather forecasting. But, after all, twenty miles is but a fraction of the distance to which the atmospheric envelope reaches. The fleecy bands of delicate cirrus cloud have been described by aerial navigators as being apparently as far removed when viewed at an elevation of five miles as they appear from the surface of the earth. The beautiful phenomena of the twilight proves that the atmosphere extends to a distance of forty-five miles from the earth. It is hardly possible to form any estimate of the extreme rarity of the air at this elevation. At such a distance from the earth, the attractive influence is weak; so that the existent air may be said to do no more than feebly dilute the ubiquitous ether which our theories of the transmission of light and heat conceive to fill all space.

The weight of the atmosphere is such that it would take 1,200,000 to equal the weight of the earth itself. At a height of three and a half miles the belt of atmosphere ascended through weighs one-half of the whole. At twice the elevation the barometer stands at between six and seven inches; while, as we have already seen, the atmosphere above the balloon floating at a height of ten miles, only exerted a pressure equal to one-seventh of that indicated at the sea-level. At a height of thirty-five miles, the outer-lying layer of air weighs only one-thousandth as much as the whole atmosphere. At twice this distance from the earth's surface, air that occupied at the sea-level a single cubic foot, would be expanded to fill a space one million times as great. Probably, air in an extremely attenuated condition exists to a distance of two hundred miles from the surface of the earth. There must be some line of demarcation approached by slight gradations of atmospheric intensity, beyond which there is absolutely no air whatever. The geographical position of this line it is impossible to locate; but it is comparatively easy to determine the conditions that must obtain there. Air, of course, follows the general law of gases, so that its particles repel each other: the earth, too, as it spins round on its axis tends to throw off its atmospheric encasement and scatter it into space. The force which binds the aerial mass to us is the earth's gravity—the attraction of gravitation, as it is commonly designated. When the point is reached where this force is equal to the two forces which tend to drive the air away from us, it is certain that there can be no air beyond. Where this point is situated, however, is another matter, for the simple reason, as the song puts it, that 'there's no one that knows.'

The investigations that have been made of late years into the question of meteorites, shooting-stars, &c., have thrown considerable light upon the question of the extent of our atmosphere. It is well known that what is commonly called a shooting-star is one of immense numbers of bodies which revolve round the sun. These our earth is continually encountering, though at certain seasons in much greater numbers than others. Altogether, it is estimated that an average of four hundred millions of these bodies come within the earth's influence daily. When fairly within the

sphere of the earth's attraction, they begin to fall rapidly towards us; and when they enter our atmosphere, the friction with the particles of air heats them to such an extent that they become luminous. This luminosity increases with the heat until, as it generally happens, the meteor is reduced to vapour, and disappears in a 'blaze of glory.' Now, it is clear that as these bodies are invisible until the atmosphere is entered, their light is due to the heat developed by friction. Consequently, if the astronomer can determine their distance from the earth when first they become visible, we are justified in assuming that the atmosphere extends to that distance. In the November meteor shower, in which the falling bodies are very small, it is estimated that they begin to burn at a height of seventy-five or eighty miles, so that we have proof positive that our atmosphere, dry and attenuated as it must there be, makes its influence very decidedly felt at that distance.

A MESSAGE FROM THE DESERT.

By ERNEST FAVENC, Author of *The Last of Six*, &c.

IN FOUR CHAPTERS.—CHAP. I.

SUNRISE on the western plains of Queensland during the tropical summer-time has a peculiar character of its own. Probably the night has been calm and sultry; but as the hour of daylight approaches, light puffs of warm wind come sighing across the almost treeless expanse. There is no hesitation about the dawn, no long, lingering half-light. A streak of gray brightens in the east, widening quickly, and turning a soft, rosy pink; it blots out all the host of stars of lesser magnitude. Soon, none save the brightest are visible. The brilliant triple-jewelled belt of Orion, most perfect of all constellations; the Cross of the South lying horizontally near the earth, with the two steadfast pointers above; and, glorious over all, in pure, lustrous splendour, the Star of the Morning, surrounded with the opal tints of the fast-brightening eastern sky.

The far-stretching plain seems now to bound into sudden distinctiveness of detail, and on the horizon a tremulous shimmering is visible, foretelling another day of heat. The sun's upper limb appears, large, red, and glowing, and all the stars die out. Angrily it looms through the quivering haze, mounts until three parts of the disc is visible, then, seemingly, gives a sudden bound of two or three degrees above the horizon, and day has commenced.

A summer's day in December! For twelve unclouded hours the orb of fire will relentlessly blast, and scorch, and wither all the surviving vegetation that the past months have spared. Soon the cattle who have been feeding out in the open country during the night-time will come slowly stringing along in single file, to seek the shelter of the trees that fringe the banks of the river. Here, in such scanty shade as the vertical sun allows the thinly foliaged trees to afford, they will ruminate all day until the cooler hours of night again tempt them forth to feed. The river is no rushing, babbling stream; for the most part the bed is dry, sandy, or shingly, the water-holes being often miles apart. For the

three months of the wet season it is a deep uncrossable torrent; for the remaining nine, a string of isolated pools.

On the bank of such a river, opposite the end of one of these pools, two men are saddling their horses. There has been a prolonged drought, and what little grass remains looks dry and white; the horses show signs of having been ridden hard the day before, and are pinched about the flanks, as if they had not made a satisfactory meal during the night. The fire, beside which the men have slept, is still smouldering, and their tin quart pots full of tea are standing near it. The saddles put on, the two men hitch their bridles on to a neighbouring sapling, and sit down to discuss a primitive breakfast of salt beef and bread, washed down with tea sweetened with coarse brown sugar. Both are dressed in collarless Crimean shirts, moleskin trousers, and leggings; both wear the soft felt hat that has superseded the once typical cabbage-tree, and carry revolvers in their belts, for it is the early days of the seventies, and this is a newly settled pioneer cattle station, and as yet the natives are still dangerous. Although one is the owner of the station, and the other his stockman, no distinction is visible either in dress or appearance. They have been on a long excursion down the river after some truant stock, and have camped for the night to recruit their tired horses.

Their hasty meal finished, they are about to mount and start, when a noise on the opposite side of the river attracts their attention. A man, on foot, comes limping painfully down the bank, and on reaching the water's edge, throws himself down on the sand, and plunging his face in the pool, drinks thirstily and greedily.

'Who can that be?' mutters the elder of the two men, for the apparition is unexpected. They silently watch the new-comer until he lifts his head after his deep draught; then one of them shouts to him. The stranger has been too eager to attain the life-saving water to notice them; but at the sound of the voice he now starts and looks up, then eagerly waving his hand, commences to cross the dry bed of the river. When he reaches the bank, he wearily surmounts it, and throws himself down with a sigh of relief.

'You seem to have had a bad time of it,' says the man who had spoken before.—'Better put a quart on, Jim,' he goes on, nodding to his companion, who puts the fire together, unbuckles the quart pot hanging by a short strap from his saddle, and goes down the bank to fill it.

The tired man recovers himself somewhat, and answers faintly: 'Yes; I am just about done.' He certainly looks it. His sun-scorched face and arms are lean and gaunt with famine; his eyes are still bright and feverish with thirst; and his belt is drawn tightly round his pinched waist. In his hand he still holds a canvas water-bag, the dry collapsed sides of which evince that it is long since it has held water. Above all, he has, in his fixed gaze and nervous manner, the indescribable appearance that besets a man after a long, solitary struggle for life.

'Where have you sprung from?' says his interrogator, after a pause, during which Jim, who has returned, places the quart pot on the rekindled fire, and produces what remnants of their meal are left.

'I started out six months ago with the Pattens, the two brothers, to look for new country; there were four of us, accounting the black boy.'

'Your name is Burgess, then, I suppose? We imagined you must have made in for the Overland Telegraph Line, as you were so long away.'

'We should have done better if we had,' returns the stranger; 'as it is, I am the only one left.'

'Is it possible? How did you come to grief?'

'We lost a number of our horses on a patch of poison-plant country—that was the first misfortune. Then no rain fell all the time we were away; and coming back, we got on to a dry stage, and found that the water-hole we had depended on had been dry for weeks. The elder Patten and all the remainder of the horses died of thirst; but the younger one, the black boy, and I, managed to reach water in the Herbert River. There, the blacks got on to us; and as we had abandoned nearly all our ammunition, we had no show at all. The boy was killed, and young Patten so badly wounded that he died two days afterwards. That was more than a fortnight ago; and I have been crawling on ever since.'

'How far did you manage to get out?'

'A long way across the South Australian border. It was coming back all the trouble overtook us.'

By this time the quart pot was boiling, the tea made; and the famished man attacked the food voraciously.

'It is ten good miles to the station,' said Hopwood, the owner. 'Supposing you rest here, and I will send a man and a spare horse down, for you to ride up.'

The other nodded a weary assent. 'Leave me your pipe and some tobacco,' he said, 'and I shall be all right.'

The two men mounted and rode away; and the rescued man, after lighting the pipe with an ember from the fire, lay under the shade of a tree enjoying the welcome luxury. His smoke finished, he rose, and looked around on the lifeless plain. No living object was visible. Putting his hand in the bosom of his shirt he drew forth some folded papers and a small note-book; then seating himself in the best available shade, with his back against a tree, he commenced to write in the note-book with the small leaden pencil appertaining to it. He wrote slowly, like a man unaccustomed to use a pen much, and it was more than an hour before his task was completed; then he leaned back against the tree, lost in thought. The place where he was had evidently on many occasions been used for camping purposes; several empty tins that had formerly contained preserved meats or fish were lying about. Rising, he picked up an empty salmon tin, and after tearing a blank sheet out of the note-book, placed the book and the other papers inside. Next he scraped the ashes of the fire away, and on the site it had occupied dug a small hole with a stick in the sandy soil. In this hole he placed the tin with the papers; and having filled it up again, rekindled the fire over the place, thus hiding all traces of what he had done. He looked carefully at the different trees, many of which were marked with initials rudely cut with knives or tomahawks; these he noted down on the blank sheet

he had retained, then stepped the number of paces from the fire to the nearest tree and put that down. He folded the paper up and put it in his trouser pocket, threw the tiny pencil on the fire, and laid himself down once more under the tree to await the coming relief.

All the time he had been occupied, his face had worn a nervous, suspicious look; and several times he had glanced stealthily around, as though even in that solitude he feared that he was watched. This look left his face as he threw the pencil in the fire, and he quickly fell into a profound, untroubled sleep. He was a young man, with a simple, honest face, though somewhat undecided and weak—a man who gave you the idea that while he had plenty of physical courage and tenacity, he could be dominated by a stronger will and intellect.

About the middle of the afternoon, Jim Turner, the stockman, appeared, leading a spare horse; and the pair were soon on their way to the station.

The homestead, called Bendabar, which they reached just before dark, consisted of a couple of huts with mud walls and thatched roofs and verandas; and a rude stockyard and milking-yard.

Burgess was made as comfortable as circumstances permitted, and in a week or two had fairly recovered from his privations, and was well enough to travel east to Rockhampton and take steamer to the southern colony where his home was.

The story he retold with more detail was substantially the same as that he first related to Hopwood. Naturally, it found its way into the principal Australian newspapers; and after exciting the usual comment, died a natural death.

Hopwood received one letter from Burgess, notifying his safe arrival, returning the money advanced for his expenses, and thanking him for the assistance rendered.

Ten years have passed, and the cattle station that was is now a well-known sheep station; a comfortable house and all the necessary out-buildings have long replaced the primitive mud huts, and miles of wire-fencing radiate in all directions. The wave of settlement has swept on to the westward for hundreds of miles, and the solitude that witnessed the fate of the Pattens has been stocked and settled.

Only one evidence of the tragedy has come to light. The bones of the horses that perished on the poison-patch have been found; but no trace of human remains has been forthcoming. Bendabar, where Burgess arrived, had been sold and resold since that event, and the occupants had changed several times, so that the story of the man's rescue was now only a hearsay tradition.

One evening a stranger rode up to the homestead and requested an interview with the manager. After presenting a letter of introduction from the firm that owned the station, he briefly stated his business. His name was Patten; he was a younger brother of the men who had perished ten years before; he had lately received a letter from Burgess, not long dead, which letter was only to be forwarded after Burgess's death, informing Patten that the writer had buried

certain papers on the spot where Hopwood had picked him up, giving him marks and indications how to find the place, and winding up with a mysterious intimation that Patten did not just then specify. 'Can you show me the place, Mr Owen?' said the visitor in conclusion.

'I know the place, roughly speaking,' replied the manager. 'It still goes by the name of "Burgess's Relief;" but without Hopwood or Turner it would be hard to find the exact spot. The last big flood altered the position of the water-holes a good deal.'

'Burgess says in his letter that it had been often used for a camping-ground, and that several of the trees round about were marked with initials, of which he encloses a list.'

'Unfortunately for your purpose, we have used a good deal of timber from that part, and ten to one these marked trees have been cut down. However, I will drive you down to-morrow morning, and we will have a look.'

Early the following day, Owen and his guest drove down to the place. 'This,' said the manager as they pulled up, 'is the place known as Burgess's Relief; but the exact spot I cannot indicate. This used to be the end of the water-hole, so I should say it was somewhere about here. As you can see, the water now extends nearly half a mile farther.'

Patten took out a piece of paper from his pocket, and read: 'Five paces up the river from a gum-tree much marked; the initials A. F. H. over J. L. facing "the plant." Another gum-tree farther down, with R. O. and M. H. marked on it; and up the river a coolibah tree with a cross on it.'

'We had better turn the horses out and have a systematic search,' said Owen; 'that coolibah tree is the best clue, as it is not likely to have been cut down.'

The horses were unharnessed and hobbled out, and the two men went opposite ways up and down the river, examining all the trees. They returned and exchanged reports of their ill success.

'Without either Hopwood or Jim Turner, I am afraid I have not much chance,' remarked Patten.

'Did you make any inquiries about them?'

'Yes, as I came here. Hopwood is in New Zealand. Turner was last heard of three years ago, going out to the Northern Territory with a mob of travelling cattle.'

'Advertise in the leading papers.'

'That will be best, I think, and quickest.'

'How were the things buried?'

'In an old salmon tin; and that reminds me that Burgess said there were many lying about.'

'There are any amount of empty tins lying about now, for the splitters have camped all up and down this bank.—What was his reason for burying the papers?'

'That I am not at liberty to relate; but'—Patten went on, as if to make up for the abruptness of this answer: 'I may as well tell you that the two relatives of mine who were lost were only half-brothers, although I find they were regarded as brothers here. The youngest was my elder, and my own brother; the other, who was six years the senior, was our half-brother.'

Whether it was fancy or not, Owen could not decide, but he imagined there was a certain ring of dislike in his companion's voice as he spoke of this half-brother.

They caught and harnessed up the horses, and were about starting, when Patten said suddenly, and as though he had been thinking the matter over: 'I may as well trust you, if I ask you to keep it to yourself. I must find those papers, for I have reason to suspect foul-play, and the truth lies in them.'

'The truth of what?' said Owen, in surprise.

'How my brother died,' returned Patten.

'Did Burgess murder him?'

'No; but he knew who did. He told some of the truth, but not all the truth: my brother's wounds were not inflicted by the natives.'

'But if Burgess did not do it, who did? Your half-brother died of thirst beforehand.'

'Did he?' said Patten, as he stepped into the buggy. 'I have a strong belief that he is as much alive as you and I are now.'

THE STORY OF A PALACE.

STRANGE have been the vicissitudes of the famous building which is henceforth to be the home of the Royal United Service Institution. Originally a Royal Banqueting House, it degenerated at odd times into an arena for the sale of pictures by auction. Next, the stately chamber became sanctified as the Chapel Royal, Whitehall; now it is again secularised for the purposes of a Naval and Military Museum.

There is no building in London more sentimentally and historically connected with the life of the nation. Its varied fortunes are inseparably bound up with the eventful story of the Palace of Whitehall. How the name Whitehall originated, nobody seems able to tell with any certainty. Philip II., in a marginal note to a despatch, says: 'There is a park between it [the Palace of St James's] and the Palace called Hlytal; but why it is so called, I am sure I don't know.' One old writer points out that Whitehall was a name sometimes given by our ancestors to the festive room of their habitations. But the place did not always bear that name; it used to be called York House. This arose from the fact that the Blackfriars or Dominican monks in the thirteenth century sold the site to the then Archbishop of York for his town residence; and he bequeathed it to his successors in that dignity. Here Wolsey held brilliant state. At the height of the wily Cardinal's affluence and luxury, he reared, in the words of an old statute, 'many and distinct, beautiful and costly lodgings, buildings, and mansions; laid out a park environed with brick and stone; and devised and ordained many and singular commodious things, pleasures and other necessities, apt and convenient to so noble a prince, for his singular comfort, pastime, and solace.' On Wolsey's disgrace in 1530, the property passed into the possession of his master, Henry VIII., and changed its name. This is referred to by Shakespeare in the lines:

You must no more call it York-place, that's past;
For, since the Cardinal fell, that title's lost;
It's now the king's, and call'd Whitehall.

Under the new regime the Palace was enlarged and beautified; but it was not until the time of James I. that there was any idea of replacing it by still more ambitious designs. Towards the close of that reign, the famous architect, Inigo Jones, prepared elaborate plans. His scheme was a stupendous one, and altogether beyond the means then available to royalty. It would have covered twenty-four acres; whereas Hampton Court Palace occupies but eight or nine acres, and St James's Palace only four. Old Whitehall had occupied a large space of ground, having one front towards the Thames, and another facing St James's Park, intersected by a public thoroughfare from Charing Cross to Westminster, crossed by two gates. The Palace had a succession of galleries and courts, a chapel, a tennis court, a cockpit, and a banquetting room. The last-named feature was burned down in 1618; and the new Banqueting House, commenced in the following year, was the only portion of Inigo Jones's design ever carried out. It was completed in 1622 at a cost of about fifteen thousand pounds. As Surveyor-general, Jones had for salary eight shillings and fourpence per day, with an allowance of four pounds a year for rent, besides the wage of a clerk and some incidental expenses.

The ceiling of the hall is lined with colossal pictures representing the apotheosis of James I., painted by Rubens in 1635, at a cost of about three thousand pounds. Two years previously the Banqueting House had been the scene of a famous masque and anti-masque, for the performance of which the services of the best English and continental musicians of the day, with the richest costumes and accessories, were secured. In the days preceding the Civil War, the hall was often used for similar revelry. Although erected for purposes of feasting and pleasure, it is mainly associated in the popular mind with one of the most tragic episodes in the history of a stirring time, for it was through one of its front windows that King Charles I. was led forth to execution in 1649. It was a bitter morning in January, and, we are told, he put on two shirts, so that the cold weather should by no chance cause His Majesty to shiver. An unknown headsmen, with his countenance concealed by a crape visor, waited outside upon the scaffold, where the block was ready for the ill-fated monarch. The warrant decreed that he should be beheaded in the open street before Whitehall—that is, opposite the main entrance to what is now known as the Horse Guards.

In March 1657 the Speaker, at the head of the whole House of Commons, repaired to the Banqueting House to present to the Lord Protector the humble petition and advice of the House. Cromwell, attended by the officers of State, went there to receive them, listened to the address of the Speaker, and promised an early reply. The 'humble advice' was the proffer of the crown. A reply came in writing on April 3d, gratefully declining the regal honour. To the same hall, four years earlier, Cromwell had returned in State from the Chancery Court, where he had received the Great Seal and listened to the reading of the Parchment reciting the powers with which His Excellency was invested.

As the last dread moments of the late king were connected with the Banqueting House, so

the first hours of the reign of Charles II., so far as concerned his public appearances, were also associated with it, for on his arrival in London he went there to receive both Houses of Parliament. Through the Lord Chancellor and the Speaker, they conveyed their felicitations to His Majesty, and received from him those assurances of future conduct which were so soon forgotten. Pepys tells us it was in the same hall that, on the 23d of June, the king touched certain poor people as a cure for the king's evil, after they had waited all the morning in the rain. The quaint diarist did not himself remain long enough on that occasion to witness the ceremony, as he records having seen it for the first time in April 1661. He says that 'Charles did it with great gravity,' and adds, 'It seemed to me to be an ugly task, yet a simple one.'

It was from the top of the Banqueting House, in August 1662, that Pepys saw the return to London of the king and his wife from their honeymoon at Hampton Court. Sometimes the tide rose so high at Whitehall as to flood the kitchens of the palace. Pepys illustrates this by a curious story of the Countess of Castlemaine, when the king was to sup with her, soon after the birth of her son the Duke of Grafton. The cook came and told the imperious lady that the water had flooded the kitchen, and that the beef for supper could not be roasted. 'Zounds!' replied the Countess, 'you may set the house on fire, but the beef *shall* be roasted.'

A still more curious picture of the water rising at Whitehall is contained in a speech of Charles II. to the House of Commons in the Banqueting House at Whitehall on March 1, 1661. 'The mention of my wife's arrival,' said the king, 'puts me in mind to desire you to put that compliment upon her that her entrance into the town may be with more decency than the way will now suffer it to be; and for that purpose, I pray you would quickly pass such laws as are before you in order to the mending of the way, and that she may not find Whitehall surrounded with water.' Lord Dorset alludes to this periodical inundation in his well-known song, 'To all you Ladies now on Land':

The king with wonder and surprise
Will swear the seas grow bold,
Because the tides will higher rise
Than o'er they used of old:
But let him know it is our tears
Bring floods of grief to Whitehall-stairs.
With a fa la, la, la, la.

In February 1688 both Houses of the Convention waited in full strength upon the Prince and Princess of Orange in the Banqueting House to offer them the crown. The Prince replied on behalf of the Princess and himself, accepting the offer. The same day William and Mary were publicly proclaimed King and Queen. It was in their reign that a great part of Whitehall Palace was burned down through the neglect of a Dutchwoman, who had left some linen to dry before a fire in Colonel Stanley's rooms. The fire raged for seventeen hours, and about one hundred and fifty houses were consumed, extending to the water-side. The Banqueting House happily escaped injury, as it again did in 1698, when most of the remainder of the Palace was destroyed. This second fire was caused by the carelessness of

a maid-servant, who, about eight o'clock at night, to save the labour of cutting a candle from a pound, burned it off, and threw the rest aside before the flame was out. It was in the Banqueting House that Prince George of Denmark was married, on the 28th of July 1683, to the Princess Anne. Evelyn mentions under date June 1693, that in the same room there took place a great auction of pictures, including many specimens of Van Dyck and Rubens, the property of Lord Melford. Ten years previously, the hall had been put to a similar use. It was then, by the king's permission, employed as a saleroom for the disposal of pictures lately belonging to Sir Peter Lely. Queen Anne permitted Sir John Vanbrugh to build from the ruins of Whitehall the inadequate premises in which the Royal United Service Institution has hitherto been located. Its style, or rather want of style, excited the scorn of Swift, as expressed in the lines:

One asks the watermen hard by
Where may the poet's palace lie;
Another of the Thames inquires
If he has seen its gilded spires.
At length they in the rubbish spy
A thing resembling a goose-pye.

With the accession of the Hanoverian dynasty, the quondam Banqueting House assumed a new rôle, for George I. converted it into a Chapel Royal. The king himself presented a rich set of plate for sacred uses. In 1723 Oliver Cromwell's grandson was married there to a daughter of Sir Robert Thornhill by the then Bishop of London. Strange to say, although the place continued to be used during many years as a chapel, both for ordinary Sunday services and on State occasions, it was never consecrated. The chapel was closed for extensive repairs in 1829, and was not reopened until 1837. In the interval, upwards of fifteen thousand pounds was spent upon it. King William IV. and Queen Adelaide attended the reopening in state, that being the last occasion on which his majesty appeared in public at divine service.

During the present reign, the Prince and Princess of Wales attended service in the Chapel Royal, Whitehall, on two remarkable occasions. One was immediately after their marriage, when the late Archbishop Tait officiated as Dean, the late Dean Stanley preaching the sermon. The second was on the celebration of their silver wedding, when the Archbishop of Canterbury was present, and the Bishop of Peterborough preached the sermon. Their Royal Highnesses attended with all their children, accompanied by the Crown Prince and Princess of Denmark. The eagles and colours taken from the French in the campaigns in Egypt, and also in the Peninsular War, were for a time placed in the Chapel Royal. These trophies remained above the altar until the building was closed for repairs, when they were removed to the new Military Chapel in Birdcage Walk.

On every Maundy-Thursdays—the day before Good-Friday—the Queen's eleemosynary bounty—a very ancient charity, for which silver pennies and other coins are specially minted—used to be distributed in the Chapel Royal, Whitehall, by the Lord High Almoner to a number of poor and aged men and women corresponding to the years

of the sovereign's age. These royal Maundy-Thursdays gifts are now bestowed in Westminster Abbey.

The Prince and Princess of Wales attended service in the Chapel Royal, Whitehall, on the Sunday of Her Majesty's jubilee, accompanied by the late Emperor Frederick and the Empress (the Princess Royal of England), when the Bishop of Derry preached the sermon. The late Duchess of Cambridge often worshipped in the chapel; and in it, during the present reign, Archbishop Tait, the Bishop of Peterborough, and other prelates, received consecration.

Several of the English nobility have of late years been married there by special license. The list includes the late Marquis of Conyngham, the Marquis of Tavistock, Lord Carrington, Lord Hastings, &c.

In design and decoration, the old Banqueting House was not well suited for a Chapel Royal; and it is no longer used for ecclesiastical purposes. In November 1890, a Gazette notice permanently closed the place for divine service; and in January 1891 the building was granted by the Queen to the Council of the Royal United Service Institution. On the 6th of June in the present year the Prince of Wales opened a fashionable bazaar in aid of this new departure, and laid the foundation stone of an extra wing designed to meet the requirements of the Institution. This extension is now well advanced, and will be completed before the end of the present year. It may be assumed that the new wing will be made as far as possible to correspond in style with the historic building which it adjoins, for that remnant is the only surviving link with the past splendours of Whitehall Palace.

THE ABSENT HEART.

By GEORGE G. FARQUHAR.

TOM OSMOND had been rejected; not, indeed, by the girl herself, but, what was likely to come to much the same thing, by the girl's father. Tom had inherited a good name, and little else, from his forebears. Add to this a good education, a smiling face, a taste, not culinary, for horse-flesh, a few odd debts in various quarters, a liberal hand—when infrequent circumstance did not stay its bounty—and there you have Tom Osmond in his means, propensities, and conditions. Mr Pentreath had put *pro* and *contra* into the scale before he issued judgment, with the result that *pro* kicked the beam viciously.

'Look here, Tom,' he had said. 'I'll speak plainly to you. Though it's her father that says it, no man breathing could wish for a prettier wife than Eva—yes, I see you admit that; and I can answer for it—here the old man slapped his trousers pocket significantly—'that she'll be a fit mate in other respects. What's more, her own ambition—no, I won't call it ambition, because there's no real ambition where there's no hill-climbing in front—but her own inclination works that way.'

'She has never given me to understand that,' interposed Tom.

'Perhaps not,' Mr Pentreath went on. 'But I've studied the child, and I see her true character

developing day by day. It's as I have said, Tom. As I've her happiness and welfare to look to, I've thought over these matters beforehand.'

'You are considerate, Mr Pentreath,' Tom said, a shade of bitterness in his tones. 'My hopes, as I now see, have been too sanguine. Although Eva and I have known each other from childhood, there has never been anything approaching love-passages between us. Yet I fancied—delusively, you say—that she did care for me. You have forced this confession from me, for of my own accord I should not—at any rate, just yet—have ventured on the subject.'

'I only wanted to warn you in time, both for your sake and for hers. I think I know you sufficiently well, Tom, to feel sure that you would not wish her to act on immature impulses. You perceive I grade you higher than I would a mere adventurer.'

'And your decision is final?' asked Tom, a slight flush overcasting his face.

'Circumstances being as they are, I am afraid I must say "Yes" to that.'

'And if circumstances altered? For instance, if I were rich instead of poor, should I then be considered worthy of her?'

'Well, then—um!' Mr Pentreath hesitated, eyeing his companion askance. 'But we'd better not consider a hypothetical case. I like you, Tom—I always did—but I've responsibilities and duties that must come before predilection—What!—are you off? I'm sorry I had to be so outspoken; but you must see it was wisest—for the best.—Good-night, Tom.'

Thus was Tom Osmond repudiated by the father before he had dared to lay bare his mind to the daughter.

The summer fast fled by; already the waning season had blotched tree and hedgerow with deeper tints. On the undulating downs above Combe Travis, frequent tussocks of long coarse grass flecked with brown patches the short, springy turf; the sweet scent of heath and wild thyme travelled on the breeze; and the brake waved cool and green as ever. Gray turrets of weather-stained granite—gaunt defences—edged the downs; in their niches grew wax-like bunches of bleached and parched sea-thrift. To seaward, the lazy waters slept unruffled. The ships making for the entrance to the Sound lay becalmed, their spread sails flapping idly. Only the swift-moving steamers, trailing lengthening clouds of thick reek across the horizon, disturbed with incongruous energy the quiet and repose of the day.

Over the hillock, close under the pinnacled cliffs, stood Eva Pentreath and Tom Osmond. It was not a clandestine meeting, as Tom had not been forbidden Eva's society. Mr Pentreath's prudence and insight into human nature would not permit him to go to that extreme. No; they met as a matter of course; it was part of their existence, part of the routine of life with them. The downs had been their rendezvous in childhood; and after Tom left college, the companionship had been renewed, naturally and mutually, as though it had never been intermitted.

Neither had spoken for some time. Eva's ringing laugh and sunny glances were held in abeyance. She stood there—a slight, girlish figure—her head downbent, so that the broad-brimmed hat hid the pretty face beneath it.

Presently, she looked up. For a moment, her eyes wandered from the little town, snuggled down by the cove, to the distant Tor, and finally rested upon the chalk-white road that wound in the coast curve towards Plymouth.

'I can scarcely bring myself to believe it,' she said at length. 'Have you really made up your mind to go?'

'Yes,' replied Tom. 'I have engaged a berth on the "Mercia," which sails for Melbourne on Friday. I only regret I didn't accept my uncle's offer when it was held out to me years ago. You see, I've done no good here; and I might have settled down to work, and have been of some use out there.'

'I'm sorry, Tom,' Eva said, in low tones. 'How we shall miss you!'

'Will you miss me?' asked Tom, taken aback at his own boldness.

'Of course I shall. No more walks together; no more delightful scamperings over the moor; no more—Why, I shall be dreadfully dull without you.'

'Yes, at first, perhaps; it will be quieter—for—you,' replied the young fellow, the light dying from his eyes.

'But you will come back?' Eva put in quickly.

'You are not going away for ever?'

'I hope not,' Tom said sadly. 'I may be away two years, five years, ten years; I don't know how long. But I shall come back, Eva—if there's anything to come back for.' He looked at her keenly.

She dropped her head again, fumbling with the sprig of heather in her hands; but she did not reply.

'You will have changed greatly by that time,' Tom hazarded, after the pause.

'Certainly, I shall. I shall be older, perhaps stouter, and most assuredly uglier,' Eva answered, the old smile coming into her face once more.—'Don't contradict! You know how I detest a flatterer.—And now, I must go back home, Tom. You will call on father to-night? Then both he and I will wish you good luck and a speedy return.'

Before the week was ended, Tom Osmond had left England.

From time to time Mr Pentreath had tidings from him. Eva was always allowed to read the letters, the more readily as they contained nothing that her father cared to suppress. They dealt exclusively with Tom's goings and comings, his life and vicissitudes. We rummage through the details to pick out the material points. The new life was laborious and trying; but Tom made light of hardships; his constitution was sound and vigorous, his thwews of steel. On reaching the up-country 'station' of his relative, he had successively been herder, stockman, and shearer, taking the rough with the smooth—and precious little smooth there was, too—till, some eighteen months after his arrival in the colony, he had been promoted to the overseership. In this capacity he had practically sole control and management of the extensive 'run,' his uncle being now too old to take an active share in the concern; while his cousin—a young fellow of about Tom's own age—was physically unfitted for the more arduous duties of supervision. Tom's later letters dwelt upon the varying health

of his uncle, and hinted—hinted vaguely only—at the possibility of the ranch being handed over to the two younger men in partnership. It may as well be known in this place that Tom never became a partner.

In the meantime, one or two events which it is necessary to chronicle had come to pass in Combe Travis. In the first place, Sir Everard Malton, having taken a lease of Combe Park, had moved into residence there; in the next place, he and Mr Pentreath became close cronies; and in the third place, Sir Everard's son, Harold, bade fair to fill up the hiatus in Eva's content caused by Tom Osmond's departure. Before Harold Malton came, Eva was just about sick of Combe Travis—sick and bored. But now her megrims fled; her vivacity and spirits returned with something of their old abandon. The mad races over the downs, the moorland walks, the fishing and shooting excursions, were again to the fore, Harold as trusty escort.

Mr Pentreath was content to let things slide; no need to spur a willing horse. Noting with approval, he remained passive. But observant as he was, one little incident never came within his ken. It occurred after one of the aforesaid gallops. For the last half-hour Eva had felt that the avowal was in the air; with diplomatic adroitness she had so far staved it off. While riding along the narrow, high-banked lane that led homeward, however, Harold leaned over his saddle and spoke. In a jumble of words he blurted it all out.

'Harold,' Eva replied softly, 'you must have understood that I did not want you to say that.'

'But you will give me an answer?' he rejoined anxiously. 'Is there any reason why I should not have?—'

'There is a reason,' Eva interrupted. 'I will tell it you when the horses are stabled. Please, do not say anything more now.'

They rode the rest of the way in strained silence.

'Now,' Eva said, when the horses were given into the groom's charge, 'will you come with me?'

She went into the house and up the stairs. Harold followed, wondering. Stopping at one of the doors, she opened it and passed in.

'This is my sanctum—my boudoir, museum, and library, all in one.—Yes,' as Harold hesitated on the threshold—'yes, you may come in.'

The room was attractively furnished and decorated. In one corner stood an open bookcase, crammed with daintily bound volumes; and on the opposite side of the window a buhl table was covered with knick-knacks and curios that had been picked up abroad. Pinned above these gewgaws, in the middle of the table, a frame of silver filigree-work held a small photograph.

Harold waited for Eva to speak again. At length she turned round, her slight figure in its well-fitting riding habit showing darkly against the window. He could not see her face distinctly.

'I did not know how else to tell you,' she said quickly. 'It is a confidence that I cannot—I dare not—put into words. But I can trust it to your keeping.' Pointing to the photograph, she added: 'That is Tom—Mr Osmond.'

Harold walked over and inspected the likeness. 'I understand now,' he said. 'I feared this.

Once or twice I have heard Mr Osmond's name coupled with yours; but your father assured me that the rumour was without foundation. Now I understand that even Mr Pentreath does not know the truth.'

'And you do not think me unfeeling—heartless?'

'Not wittingly. I myself am solely to blame. I have been mistaken; and I will respect your secret. It is safe with me as long as it pleases you to make a secret of it.'

'We can still be good friends, Harold?'

'I hope we always shall be,' Harold rejoined. 'I beg your pardon, Eva, for what I have said, and I pledge myself not to repeat an offence that pains and grieves you.'

'Thank you, Harold. You did not know.'

To outward seeming, their intimacy continued as heretofore; but essentially there was a difference. Neither of them could well have said in what the difference consisted. Maybe a shadow fallen between them—impalpable, yet ever-present—seemed to necessitate a cold, studied courtesy on Harold's part; and on Eva's, a wary restraint, which her father construed in his own way. Maybe it was a shadow; maybe 'twasn't.

Sir Everard and his son were dining at Mr Pentreath's one evening, when the two older men became engaged in a discussion which monopolised the whole of their attention. Harold contented himself with listening; Eva, sitting opposite him, had been strangely silent all through the dinner. Happening to glance towards her, Harold saw that her eyes were fixed upon him. She dropped her gaze, a vivid flush burning her cheeks, and tried to cover her confusion by asking some trivial question. He replied in a matter-of-fact way that belied the tremulous beating of his heart.

In the drawing-room the debate waxed hotter, and to settle a disputed point it became necessary to refer to a book in the library. Harold volunteered to fetch the volume. On his way down-stairs he passed Eva's boudoir, the door of which was half open. There was a light inside. Stealthily, as if he were in the act of committing a heinous crime—as indeed he was—Harold peered in. He started violently. Then, marching boldly forward, he strode up to the built table. Tom Osmond's portrait was gone. In its stead, that of Harold himself stared out from the frame of Indian metal-work.

'My promise!' he ejaculated. 'Never to speak of that again so long as it annoys or pains her. So long! Does she not now absolve me? Would it pain her now?'

Nearly three years had gone since Tom Osmond left England, and three more months passed before his last letter reached Mr Pentreath. That gentleman read the missive from end to end in his usual thorough and methodical fashion. This done, he leaned back and ruminated.

'Uncle and cousin both dead! Tom heir to his relative's wealth and property—a quarter of a million, I've been told. A tidy sum—a tidy sum. Tom's a lucky fellow. I'm glad for the lad's sake; I always did like Tom.—But how's this he finishes his letter?—"I have almost completed the arrangement of my uncle's affairs, and I have already engaged a passage for Plymouth by the

'Vulcan.' Again I will ask you a certain question. What will be your answer?" Umph—umph! Perhaps I'd better not let Eva read this. Ah, well, well.'

Eva never did read that letter, for there and then her father tore it up and flung the shreds upon the fire.

The 'Vulcan' steamed slowly up the Sound, past the breakwater. Her passengers, thronging the deck, hungered to get ashore and greet their friends. Apart from the rest stood Tom Osmond, bronze-visaged, the lines around his mouth deeper, and perhaps harsher, but otherwise little altered from the Tom Osmond of bygone days.

'I wonder if they'll be here to meet me?' he thought.—'No; that's expecting rather too much. Still, they might; I hope *she* will. How she would have teased if she could but have seen me in my beard. Ha, ha! However, that's gone, and I flatter myself I look something like a civilised being again.—Why, there she is at the end of the quay! I'll swear that's her blue dress, and— Pshaw! What am I thinking about? She'll have cast that aside years ago.—No; that's not Eva.'

Neither that nor any other. Tom landed amid a crowd of hustling strangers. Not a friend to meet him. He knew not one, nor was he known by any. Stay; there *was* one who recognised him; it was old Bilstow, Mr Pentreath's gardener.

'If you bain't Mr Tom, I'm grievous mistook,' he said.

'Why, Bilstow,' cried Tom, 'how are you, and how are they all at Combe Travis?'

'Oh, main gay an' spruce, Mr Tom. I've just come fro' the weddin'—a fine un too—up at St Andrew's.'

'The wedding?'

'Ay; Sir Everard's son, Harold, an' Miss Eva. They've just gone to the station. They're a-goin' to spend the honeymoon in Wales som'eres.—Hear that whistle? That's their train, I'll be bound. A bonnie couple they looked an' all.—Ay, but everybody'll be glad to see you again, Mr Tom.'

Tom felt a choking sensation at his throat; his heart sank. And this was his welcome home.

OYSTER-CULTURE IN FRANCE.

ARCACHON, in the department of the Gironde, is a favourite summer watering-place for the Bordelais, and a winter health resort for the whole of France. But apart altogether from its reputation as a health resort, it is famous for the supply of oysters which it yields to France and to the world. The oyster industry of France is the largest of its kind in Europe, and at Arcachon it is carried on in the most scientific and systematic manner. It was about the middle of the present century that the work of oyster-rearing was commenced here, a work which to-day gives employment to thousands of people, men and women, in the villages which surround the Bassin. The Bassin of Arcachon, with a circumference of about sixty miles, from its physical formation is peculiarly favourable to the rearing of the oyster, being a bay completely protected from the storms

of the ocean by a natural breakwater of sandhills, some of the highest dunes in the world. Were the entrance from the Bay of Biscay a deep and navigable channel instead of being, as it is, dotted with shifting sandbanks, the Bassin would form a perfect natural harbour. At low-water it will be found to be covered to a large extent by sandbanks, separated by numerous and deep channels; and it is on these sandbanks, called *crassats*, that the oyster parks are formed in a manner we shall endeavour to describe.

The site of a park having been determined upon, it is divided into rectangular portions which measure forty yards by thirty, and which are called *claires*. These are separated from each other by dykes of clay a foot in height by two feet broad, strengthened by planks resting on piquets firmly fixed in the sand. Around a group of *claires* runs what is called a *blindage*, a netting of galvanised iron wire, as a protection to the oyster against its numerous enemies, among which the crab is chief; but whelks, starfishes, and boring sponges are dangerous. Many oyster-rearers from reasons of economy form a blindage of the branches of a tall and strong heather which grows abundantly in the neighbouring forest. In addition to the protection from the attacks of ravenous fishes afforded by these two systems, they also serve to retain the oysters within their limits, and prevent their being carried by seaweed or other cause from one man's park to that of his neighbour. Another plan often adopted to ensure further protection to the precious mollusc consists in the formation around the *claires* of a line of *pignons* or young pine-trees, stripped of their branches with the exception of a plume at the top. The *pignons* are three yards in height, and at high-water, with their waving plumes, act as a sort of scarecrow, or, under the circumstances, as a sort of scarecrab.

The formation of the *claires* being completed, near them are deposited several wooden frames, like cages, to hold layers of tiles of a length of eighteen inches, the frames themselves measuring two yards long by two feet broad and one yard in height. The tiles have convex and concave sides, and are at first whitened in a bath of chalk and water mixed with a little fine sand; and after being well dried in the sun, they are laid in the frames, each of which holds eight or ten rows. Here they become covered by young oysters to the number of two or three hundred per tile. This takes place during the months of May and June, for it is in May that the spawn appear in the oyster as a liquid substance of milky appearance, and render it uneatable until the month of September. This fact gives rise to the saying, that oysters should be eaten only in those months whose names contain the letter *r*.

The tiles are left thus to be washed by the tides until October, when they are removed for the delicate process of *detroquage*, a process consisting in removing each oyster from the tile in such a manner as to leave a thin and small fragment of chalk adhering to each shell. It is performed by young women, who use a knife specially manufactured for the purpose, and requires the greatest care in execution, in order that the young and fragile oyster may not be destroyed. Those surviving this operation are next passed through two riddles, the meshes of

which vary in diameter, and being thus assorted according to size, are placed in cases called *ambulances*, frames of wood two yards by one, covered with a netting of tarred wire, to permit the free circulation of the water. These *ambulances* are firmly fixed in the sand at the park by means of well-driven piquets, and are the invention of a local culturist. In the ambulance, an oyster will rapidly increase in size, and attain in a few months a diameter of one or two inches. At low-water the *ambulances* with their contents receive a good watering at the hands of the *parqueurs*, and this in addition to the covering by the tides twice daily in the natural course. After a sojourn in the ambulance for some months, until sufficiently strong for the purpose, the oysters are scattered abroad like seed in the open *claire*, where they assume a flat form, and lie for several months until the harvest.

In order to watch the progress of much of the work before described, it is by no means necessary to cross the channel to the oyster parks lying in the centre of the Bassin. The *plage* or beach at Arcachon, La Teste, and the numerous villages on the bay, is at all times dotted with the *parqueurs*, busy in the various departments of their profession. Here is a group of men and women sorting the edible oysters just brought ashore into various sizes and prices; there, another group at work, cleaning and scraping or whitening the tiles, or detaching therefrom the young shellfish, each operation in its own season. There is no mistaking 'Madame la Parquense,' dressed as she is in her red flannel knickerbockers and long boots, sometimes with legs bare, and feet in large wooden sandals for more convenient walking on the sand. The men are, as a rule, dressed in suits of blue cotton, with scarlet sash, and head covered with the popular blue *béret*. The *plage*, too, is covered with the various implements of the fishery. Piles of tiles are everywhere to be seen; *ambulances*, broken and waiting repair; groups of miscellaneous articles, as baskets, rakes, spades, wheelbarrows, and wire; bundles of *pignons* and stacks of heather, ready for transportation to the park itself.

But it is necessary to take a boat and engage a man as guide, in order to see many of the most interesting scenes connected with the industry, among them being the gathering of the edible oyster, which is judged eatable by its size, nothing under an inch and a half in diameter being allowed to be sold. This harvest takes place every day except during that period from May to September when the fish are uneatable for the reasons already mentioned. A practice fatal to oyster-culture, and one which almost always results in the destruction of beds by over-fishing, and the removal of the breeding oyster—namely, the use of the dredge in fishing—is here unknown; and that its use at Arcachon is unnecessary is one chief cause of the success with which the culture is carried on, and the dimensions to which the industry has grown. Low tide is of course the time for fishing, for then the sea recedes from the *claires*, leaving only sufficient water to cover the oysters. The method of procedure is for a number of men and women to form a line at one end of a *claire*, and work slowly to the other, each carrying a rake, which

reveals the sand-covered oyster, and a wire-basket to hold the proceeds of the fishery. On the completion of one *claire*, another is commenced. At the end of a day's work, when the incoming tide will permit its continuance no longer, the results are carried ashore, and either deposited in the floating warehouses anchored near the beach, or transported by steamboat or railway to their ultimate destination. A large quantity of the finest oysters are transferred to beds in other places, to be fattened, as this process cannot be brought to perfection in the locality.

A strict watch is kept by day and night over the parks, so that no amateur may try his hand at oyster-gathering. For this purpose are the numbers of houseboats which are to be seen dotting the bay, their white roofs shining in the sun. These contain bed and board for the guardians of the parks. On the 'Ile des Oiseaux,' in the centre of the Bassin, are cabins for the same purpose.

Though hardly the place for a successful pearl-fishery, pearls have been found in Arcachon on rare occasions. The local museum contains as a curiosity three found together in one shell some years ago. The only other occasion we know of was quite lately, when the writer himself was the lucky finder.

Great as is the number of oysters exported from Arcachon annually, it is estimated at not more than two per cent. of those born; and this is comparatively a very large proportion, due to the elaborate manner in which the industry is carried on. It has been estimated that for every oyster brought ashore from the natural beds of Germany, more than one million die. The number to which a mother-oyster gives birth is so large as to be almost incredible, and of these only a very small proportion find their way to the chalk-covered tiles placed for their reception. Many of course are destroyed in the numerous processes through which they pass during the three or four years necessary for such perfection as is attainable in the locality.

Altogether, it is an interesting industry, and one in which the picturesque abounds. A pretty sight, the return of the boats on a full tide, after a day's work, when the many sails, white and terra cotta, dot the clear blue water under a clear blue sky, with a gray line on the horizon, the distant, pine-covered sandhills.

THE 'AWETO.'

THE Rev. C. Parish, Taunton, favours us with the following note on the above:

In an interesting article on 'Some New Zealand Peculiarities' in *Chambers's Journal* for the month of September, the writer mentions, as perhaps the most remarkable of them all, an object called by the Maoris 'aweto,' of which he says 'one is uncertain whether to call it an animal or a plant.' Perhaps the following explanation of this phenomenon may be welcome to some of the many readers of the *Journal*.

The strange object—and very strange it undoubtedly is—has been long known. It is a fungus—named 'Sphaeria Robertii'—which fastens on and grows out of the dead body of a caterpillar, which caterpillar retains its form in a

dried state at the base of the vegetable growth. It is well known that many caterpillars, notably that of the Gooseberry Sawfly, after feeding on the leaves of the plant they affect, drop on to the ground, and, there burying themselves, turn into the pupa or chrysalis stage, out of which, if no misfortune happen to them, the moth, or butterfly, or winged insect, be it what it may, emerges in due season, to recommence its cycle of depredation. The caterpillar in question, which undergoes the remarkable and unusual transformation mentioned by the writer of the article, is that of a New Zealand moth, 'Hepialus virescens;' and it feeds on the leaves of the 'rata' tree ('*Metrosideros robusta*'), which is correctly described as 'a kind of flowering myrtle,' for the tree belongs to the natural order Myrtaceae. When the caterpillar falls to the ground and buries itself, there fasten on to it what, for simplicity's sake, we may call the seeds of the fungus; and finding in its body a suitable nidus—as, once more, the writer correctly supposes—they permeate its substance, killing the unfortunate caterpillar in the process, and ultimately growing out of it into the fully developed 'plant,' eight to ten inches in height. But although this takes place at the cost of the caterpillar's life, the outward form of the caterpillar is preserved in a desiccated and hardened condition. A drawing of this singular production may be seen in Lindley's 'Vegetable Kingdom,' where he treats of the Fungal Alliance.

As for the difficulty of understanding how the species is propagated, there really is none. It is to be presumed that only a certain proportion of these buried caterpillars meet with this strange fate, and that at least a sufficient number remain unattacked by the fungus parasite, free, in the regular course of nature, to become moths and reproduce their kind. It is not only in New Zealand that a fungus plays this part; in England also a species of the same genus is found, 'Sphaeria entomorphiza,' though it is extremely rare, which, as its name implies, is parasitic on animal life, being found on dead larvae and pupae of insects.

Another species, if really another ('*Sphaeria sinensis*'), is sold in China, tied up in small bundles, being esteemed for its supposed medicinal properties.

SONNET.

I GRIEVE beside thee; yet I would not weep
So loudly that I might disturb thy rest;
I would not stir the silence of thy breast,
Nor break with distant dreams thy quiet sleep.
I would not any thought of me should creep
About thy heart to hurt thee—Pain so pressed
Upon thee, that I whisper: 'This is best,
So tranquil lying after anguish deep.'
Yet I have loved thee well—and Life grows drear
And dark for me, who hold my sobbing breath,
That so I break not on thy slumber, dear;
Heart-sick by thee, my love yet lingereth,
Careful upon thy brow to drop no tear,
Lest I should draw thee from the peace of Death.

THE FOREIGN OFFICE.

WHERE is it? From a pleasantly placed window in an upper storey you can look across to the Queen's London residence, Buckingham Palace. Eleven months of the year its white blinds are drawn and the standard staff is flagless. Between lies the lovely lake in the park of St James's, teeming with tribes of fancy ducks, the rarest of them originally put there by Charles the Martyr—ducks of strangely varied plumage, flying ducks, and ducks that dive deep down for two or three minutes at a time. The children are watching these aquatic capers, and throwing morsels of bread and cake to their feathered playfellows. Then the bell on the little island rings—the ducks' dinner bell—and there is a quacking race with web and with wing for the feeding-ground. A gentle breeze stirs the foliage of a thin forest, some of whose trees watched the first Charles walk to his doom in Whitehall here. And there are flower-beds ablaze with the season's blooms, and the gardeners are sweeping the walks and mowing the grass. And the sheep are browsing on the green, undisturbed by here and there a tired workman, who makes his mid-day couch among them for a brief rest. Above the red and venerable bricks of St James's Palace and Marlborough House is fashionable Piccadilly, with the towers and turrets of its Clubs and town-houses. Then house-tops and spires and domes on every hand; and far away the lazy hills of Hampstead Heath and Harrow—one of the finest views of the vastness of regal London. We are here on the pivot of the Empire, and grouped around are the hoary buildings of the Admiralty, the Horse Guards, the Treasury, the Privy-council, ending in the straggling and sternly unadorned residence of the First Minister of the Crown. A wide survey that recalls echoes of the past, and cannot fail to impress the emissaries of foreign potentates who come to discuss the affairs of nations.

As for the business of the Foreign Office, it is peculiarly different from that of other departments of Government, as it is mainly occupied

with questions of State, and not with the affairs of individuals. From such a statement it might be supposed that all the Foreign Secretary does is to make himself all roundly agreeable in good French. But that is the mere playtime of his post; and his five thousand pounds a year is not a great lure for a wealthy Marquis or Earl to devote himself to a duty which compels him to scorn delights and live laborious days. We propose to show that any such popular theory of the Minister's leisure is wrong as wrong can be.

The office of Secretary of State for Foreign Affairs was instituted in 1782. It has always been held by some hereditary peer, with two notable exceptions—Fox in three governments, and Canning in two. It is an office of titles and orders, on the principle that its functionaries may stand on equal titular terms with the Counts and Pachas and Señors who come to us. It is always Sir Somebody Something that is selected to answer for our foreign policy in the people's chamber of our legislature. But to the business of the office. It would not be inappropriate to describe the Foreign Office as the biggest newspaper office in the world, albeit its ways are not the common hazards of journalism. It is often slow, generally sure, certainly cautious, calm, and deliberate. For so prosaic an institution to have a motto is strangely surprising; yet, as a ribbon to the dome that overhangs the grand and gilded staircase, there runs round this legend: 'Let the people praise Thee, O God; yea, let all the people praise Thee; for Thou shalt judge the folk righteously, and govern the nations upon the earth.' Above this stand figures symbolically representing all the tribes remote or near with whom we have diplomatic dealings. These nations we in our own way have classified as First, Second, Third, &c., rate 'Powers;' and according to these classes are fixed the rank and the styles of our State representatives. The first-class powers are France, Russia, Turkey, Austria, Germany, Italy, and Spain. To these we send Ambassadors Extraordinary. We have not yet honoured the United States of America with one

of these highest dignitaries of State. The salaries paid to these ambassadors are as follows: Austria, £8000; France, £9000; Germany, £7500; Italy, £7000; Russia, £7800; Spain, £5500; Turkey, £8000. In addition to these salaries, the ambassadors have practically small palaces to live in; and they are also allowed special funds for the purpose of entertaining the dignitaries and the officials of the various Governments to which they are accredited.

To the powers of second rank we send Envoys Extraordinary, in number seventeen. Minor states have Ministers Resident; and the complement of the Diplomatic Service is made up of *Chargés d'Affaires*, Secretaries of Embassy or of Legation or of other grades, and *Attachés*. In all they come to one hundred and fifty.

Then come the Consular Corps. In importance of rank they are arranged thus: Agents-general, Consuls-general, Consuls, Vice-consuls, Consular Agents, and Proconsuls. All told they come to about nine hundred. The methods of the Celestial and Oriental nations call for special treatment, and so to China, Japan, &c., we send about a hundred more representatives. The rear rank of our Foreign civil army is composed of a few half-dozen Chaplains.

To look at the work done by both branches of this foreign service. The diplomatic body are engaged on purely 'State' matters. The Ambassador or Minister goes direct to the Government of the country where he is, with reference to any matter which the Foreign Office asks him to investigate or to arrange. In these official communications there is a very strict etiquette preserved; only those of correspondingly equal rank may address each other in correspondence. Bearing out the old maxim of '*littera scripta manet*,' no agreement or proposal is considered definite or conclusive until it is reduced to writing. It is a fixed rule of our Foreign Office that every document, down to the merest scrap of paper, shall be carefully preserved. The head of what is called the Librarian's Department is officially described as the Keeper of the State Papers. These papers are all sorted, '*précis*-ed,' indexed, and catalogued in such a way that at even a few minutes' notice any precedent or fact may be easily fingered. The last resting-place of the State Papers is the Record Office, and it is there that the writers of history go for first-hand authentic information. As has been said, there are two branches of our foreign civil service—the Diplomatic and the Consular. The members of a legation are engaged in sending home reports of the action of foreign parliaments, conversations with their colleagues of other nations, public opinion on various questions as exhibited in the country's press, the state of trade and commerce, and so on—in short, writing intelligently the history of each week and year.

The Consular officers have to deal with more limited spheres; but each one has to send home a strict account of his doings—whatever he has had to do with British seamen and shipmasters, the relieving of the unfortunate emigrants from his own country, local topics, the statistics of the trade of his district, and anything and everything that he may in his judgment deem to be of interest or importance.

A simple addition sum shows that we have

nearly twelve hundred correspondents all over the world in direct or indirect communication with the Foreign Office. Their despatches we shall speak of presently. The 'staff' required to deal with these is generally about one hundred and fifty. Ten special foreign service messengers are engaged in taking to and fro special despatches from various courts, and their business is no light work. A good story is told of one of these who had gone for a holiday to the Riviera. He received from London the following telegram: 'You are fast and dirty; return at once.—SALISBURY.' Full of wonder, he repaired home to find that the telegraph should have told him that he was 'first on duty.' Official caligraphy must be held responsible for the libel.

It needs very little reflection to calculate what a mass of correspondence has to be dealt with here. It is no unusual thing for an ambassador to send home a thousand despatches in a year. Some of these often run to fifteen or twenty foolscap pages. As definite figures can be made to do anything, perhaps it will be better to leave the multiplication to the imagination of the reader.

Despatches of special secrecy or confidence are always sent by a special messenger, or written in cipher. The handbooks of private cipher are constantly being compiled anew. To give a specimen of a cipher despatch: it would convey little to any one not possessed of the key to receive an instruction running, 00,100, 34,346, 07,084, 55,528, and so on. Or this: 'Chessboard, potato, elegant, donum, pert, sacrilege, merciless, toga.' Yet each of these words is a sentence in itself.

On the receipt of the despatches at the Foreign Office, it is the business of the resident clerks to sort them out and to send them to the different departments. In the distribution of business we find such headings as Political, Consular, Treaty, Commercial, Sanitary, &c. Each despatch bears on its back the evidence of its history—its date of sending and of arriving, a '*précis*' of its contents, the successive suggestions of those through whose hands it passes, and lastly, the red ink '*fiat*' initial of the Secretary of State. From each of the superintending secretaries of departments are sent every day to the Secretary, wherever he may be, despatch boxes with different coloured slips of paper—white, green, or red—according to the urgency of their contents. Every single one of these comes under the personal scrutiny of the Minister. The would-be historian who haunts the Record Office will not find one that has not the initial of a Wellington, a Clarendon, a Salisbury, or a Granville. To read and to know the letters of a thousand correspondents is in itself no easy undertaking. But there is more than this. Imagine the burden of communication with the Ministers of other countries, and with the different departments of Government here—Home, Colonial, War, Treasury, &c. The foreign ambassadors come and go incessantly—Frenchman and Dutchman, Swede and Spaniard, Turk and Tartar.

The last branch of the Secretary's occupation is to attend to the petty pestering of all sorts and conditions of people at home. One wants to know the state of the law on a special point in some foreign country. Another would like

inquiries made about the will or estate of some alleged relative who is supposed to have died somewhere. A third has a claim against a foreign country for the modest amount of a million sterling, and wants it collected at once. To each of these correspondents the reply courteous must be returned. All this literature is styled 'Domestic—Various.' It is painfully domestic, and charmingly various.

We have endeavoured to give some small idea of the work of our Foreign Secretary. The man who fills the post must be unusually careful, tactful, active, and alert. And withal he may fitly be described as the Atlas of the British Empire. Perhaps that simile may furnish an apology ample enough for his sometimes slow steps. At any rate his seat in the British Cabinet is the least easy-chair of all.

POMONA.*

CHAPTER XVI.

Some there be that shadows kiss;
Such have but a shadow's bliss.

SHAKESPEARE.

A FEW days after this, Lady Lester's carriage was making its way through the crowded thoroughfares of the City towards Dalston.

Pomona had received all the information Mr Freestone could furnish her with, which was meagre enough. Miss Lester had married a Dr Merridew, who lived then, and, according to the Directory, lived still at 37 John Street, Dalston. The old lawyer told Pomona how greatly incensed the family had been at the marriage. Sir Hugh had come into the title ten years before, and the Dowager Lady Lester lived in the dower-house with this one surviving daughter, who was a good many years younger than Sir Hugh.

'Lady Lester made a great deal of this daughter, and spoilt her, I fancy; and from all I heard, I believe she was a wilful, headstrong, young lady, who had never been crossed in her life about anything; and when she took it into her head to marry the young doctor, nothing on earth would turn her from it. Sir Hugh stormed, and the Dowager coaxed; and I was even called in to reason; but I never in all my experience knew storming or coaxing, much less reasoning, turn a woman's mind one hair's-breadth to right or left—if you'll excuse me saying so, Miss Lester. I think the Dowager Lady Lester would soon have made up her mind to the inevitable if she had lived; but, poor lady, she caught a cold on her journey from Paris, and died after a few days' illness; and this increased Sir Hugh's resentment against his sister, as he considered—and perhaps rightly—that his mother's death had been hastened by trouble of mind and worry. And then, a few months later, we heard of Mrs Merridew's death; and not long afterwards came that terrible railway accident in which the two boys lost their lives; and the next year Sir Hugh followed them. He never got over the awful shock of their loss. They all of them went within eighteen months, the Dowager, her daughter, and Sir Hugh and his two boys.—Dear!

dear! the ways of Providence are very mysterious!' And the old lawyer shook his head gloomily; and Pomona sighed, with the very mitigated sorrow one feels for long past troubles.

'My mother says she is afraid they are not very well off.'

The lawyer smiled. 'A doctor in Dalston is not generally very wealthy.'

'Have they ever asked for assistance?'

'Never through me; and I do not fancy directly to her ladyship; so I conclude they have never been in great distress.—But I recollect hearing at the time that the doctor was an independent, high-spirited, young fellow—not at all the sort to come sponging on his wife's relations.'

'I wonder what the daughter will be like?'

'Would you like me to go and find out?'

'No. Lady Lester wants me to go; and I feel so curious about it myself. You see, she must be just my age; and, of course, being first-cousins, we may be very much alike.'

'I hope she may be, my dear.' The old lawyer looked with kindly, fatherly eyes on the bright, lovely face opposite him in his dusty, old office. It was not often that anything so fair to look upon sat in that worn leather chair, with the background of dull law-books setting off her fresh beauty. 'But you must not be disappointed if you find something very different. Of course, she has been very differently brought up from yourself. I daresay her father has not been able to afford much of an education; and, of course, she has never been into any society.'

Lawyers are not as a rule imaginative; but before Mr Freestone's mind's eye arose the vision of a common-looking, ill-bred girl, dressed with shabby smartness, with uncouth or vulgarly pretentious manners.

'If you will take my advice,' he said, 'you will be a little careful how you encourage anything like intimacy. People of this sort are sometimes rather awkward to keep in their place.'

She looked up at him with a little surprise in her clear eyes. 'You see,' she said, 'she is my cousin. There is no one so near me except my mother.'

Her heart was very full of the story as she drove away from Lincoln's Inn, trying to put herself in the place of that young, self-willed aunt, dead these twenty years, who had left everything for the man she loved. Pomona had read plenty of love stories; but there was a reality about this that brought it home to her, and set her wondering whether there would ever be any man in the world who would have any power over her to compare for a moment with the least feeble movement of her mother's hand. 'I don't believe,' she told herself, 'that if I loved a man with all the concentrated love extracted out of all the three-volume novels at Mudie's, with a dozen poets thrown in, and were married to him twenty times over, that, if my mother whispered, I could help going bundling home again.—She was an only daughter, too! How could she have done it? But I don't think other girls love their mother as I do mine, and I expect that is why I never seem to care about men, as other girls do.'

But here the carriage stopped, and the footman,

* Copyright reserved in the United States of America.

coming to the door, announced that this was the address given.

'I don't think this can be right, William,' Pomona said, looking doubtfully at the shabby little house. Sage's home did not present itself so favourably to Pomona's first gaze as it had done to Maurice's. There was no charitable fall of snow to throw its kindly mantle over defects. Next door, the dust-bin was being emptied, and a very grimy man, with a basket full of ill-smelling rubbish on his shoulder, stood on the area steps gazing at the elegant carriage drawn up just behind his cart. 'This is John Street, Dalston, Miss.—Ain't it, Thomas?' the man answered, appealing to the coachman, who, perhaps, might have more acquaintance with the low parts of London than he possessed himself. The coachman having corroborated the fact by a sideways nod, William went on: 'And this is No. 37, Miss. Shall I knock?'

She bade the man knock; and when Sarah opened the door—and again Providence had not been kind in the matter of dirty aprons and gaping seams—she herself asked if Miss Merridew were at home.

Sarah was so appalled by the grandeur of the carriage and the height of the flunkey towering above her on the door-step, that the question had to be repeated before she could close her mouth gaping with amazement, to answer that she did not know, but would go and see. And then, remembering her manners, she requested the lady to step in, and ushered her into the sitting-room, where the fumes of Irish stew lingered powerfully, and where Sage's work-basket, heaped high with stockings for darning, was the only ornament on the table.

'Miss Sage'll be up-stairs,' Sarah said, lingering for another stare at the elegant dress and gracious face.

'She might abeen the Princess of Wales and all the Royal Family to look at her, and you wouldn't never ab'lieved as she wasn't a Duchess at the very least, or an Honourable, or something fine,' Sarah described to the woman at the green-grocer's round the corner, who was her special cronny. 'And would you b'lieve it; she were only just plain Miss, same as you and me, for she says, "It's Miss Merridew I want. Will you tell her Miss Lester is here?"'

Sage had been a little out of tune all day. She was somehow more inclined to these moods nowadays, than in the old serene days before she had tasted of the cup of happiness. She could not account for this at all herself; and she took herself to task very severely for selfishness and ingratitude, for was she not the happiest, luckiest girl in all the world, and Maurice the most ideal lover girl ever had?

This morning had brought her a great 'disappointment, though she protested bravely to her father that it was not so, and that she was very glad to stop at home. Owen Ludlow was coming back to-day from Scar, and Maurice had promised to come and fetch her that afternoon and take her up to Regent's Park to tea. And now, some other engagement had turned up that would take him out of town for several days. An old uncle of his in Sussex had asked his assistance over some business with which he was occupied; and as this uncle was well off and had no family,

it might be of advantage to stand well with him. Maurice said he felt it was quite a duty to go; he could not afford to lose any chance, now that he had his little lady-love's future to think of as well as his own.

But in spite of her declaration, Dr Merridew was not quite convinced; and although she was unusually cheerful over breakfast, he fidgeted about before starting on his rounds, as if he had something on his mind. 'Look here, Sage,' he said at last: 'if I look sharp and get my visiting done, I don't see why I couldn't get an hour or so free this afternoon to go with you up to Ludlow's. It seems a pity you should be disappointed.'

'Disappointed?—you dear, old goose, disappointed? I'm not a bit. I'd a great deal rather stop at home. I've heaps to do; and it was really quite a worry to think how I could get it all done if I went off this afternoon. And besides, don't you see? if I'd set my heart on going as much as you fancy, I could take Kitty, who'd be only too pleased, and needn't drag you all the way.—But it *was* good of you to think of it—only, you see, I don't really care to go.'

'With any one else,' Dr Merridew said to himself, with a little sore feeling at the heart.—'Well, well! fathers don't count for much when lovers come on the scene.'

And Sage, when he was gone, to prove conclusively that she was not a bit disappointed, leaned her head on her hands and sobbed. Then, with that perverse tendency many have to make matters worse, and if one thing happens to upset one's peace of mind, to upset everything else, and be thoroughly miserable while we are about it, Sage filled up the day with all the most distasteful occupations ingenuity could devise—unpleasant works of supererogation in the matter of turning out cupboards and tidying remote corners; and was just drearily washing her hands preparatory to a long afternoon of darning, when Sarah came up to announce that a young lady was in the parlour 'as come in a beautiful carriage and pair; and ain't you better put on your new dress as is hanging in the cupboard in master's room, and only wish as I'd had a moment to clean myself,' Sarah said, all in one snoring breath, regretfully contemplating the state of her apron; 'and my gound all bust out under the arms, too; but I was took all of a hop, and didn't know but what it was the rates as comes that imperent with a double knock.'

'What name did she say, Sarah?'

'I think it were Miss Lester; but I ain't sure, being in a flurry like.'

Who could it be? One of Maurice's fashionable friends come to look her over and criticise her? A sudden fit of shyness and shrinking came over her. Why should she go down? In fashionable circles she knew they thought nothing of saying 'Not at home,' not reckoning it a lie because it was so generally done. Why should she not do the same, and send Sarah down with such a message? Even in her embarrassment, she laughed at the idea of Sarah's amazement at being told to do such a thing, and the way in which she would execute such an order.

Miss Lester? She seemed to recall the name; but once or twice, when Maurice had described parties he had been at and people he had met,

she had been a little stiff and indifferent, and Maurice had dropped the subject. She wished now that she had been more sympathetic and interested. It would be so stupid if this were one of Maurice's friends, and she knew nothing of her, not even her name!

All these reflections flashed through Sage's mind as she went down-stairs, not having, as Sarah suggested, made any change in her dress, not even taking off the uncompromising apron which she had assumed preparatory to her mending labours.

Pomona was standing with her back to the window, and perhaps it was this and the shyness that prevented Sage from looking calmly at her visitor, and so kept her from seeing the likeness to the picture which had struck Maurice and so many others. She was only conscious of a very tall and elegant girl, beside whom she felt small and shabby and ill at ease; and who, in return for her somewhat formal, little bow, came towards her, holding out both hands, and saying, 'It seems so very stiff to call you Miss Merridew, as we are cousins; but, do you know? I don't even know your Christian name.'

'Cousins?' Even now Sage had a dim idea that this was some relation of Maurice's treating her as kin already, by virtue of her engagement to him.

'Yes; we are cousins. My father and your mother were brother and sister.—May I kiss you, dear?' And Pomona bent and kissed Sage's cheek. 'I am Mona Lester.'

And then Sage looked up into the bright, beautiful face bending over her. 'Pomona!' she said.

'Yes, dear, Pomona.—Ah, you knew my name, though I do not know yours; but you must tell me.—Sage, is it? What a pretty name! But, Sage, you look quite startled, and no wonder, with me pouncing down on you all of a sudden. Are you always such a pale, little cousin? Do you mind my looking at you? Do you know you are ever so much more like the Lesters than I am? There are several of the portraits at Beechfield very like you, and your face seems quite familiar to me.'

'But—Pomona'—

'Yes, call me so, if you like it. But I am always called Mona at home. Pomona is such a queer name—not pretty and quaint, like Sage.'

'But the picture?'

'Oh, have you seen it? Isn't it a very curious thing there should be such a likeness? And they say the painter painted it from the memory of his dead wife.'

'It was the picture I meant when I said your name.'

'Was it? That was curious! Then you had not heard of me any more than I had of you?'

'No. I remember once father saying there was a cousin I had never seen. The others have cousins.'

'The others?'

'Yes; didn't you know that father married again. There are Kitty and Nigel and Dennis and Will.'

'Oh, Sage, isn't it odd that you and I should have to tell one another all our history, just like strangers? But I don't feel like a stranger. I

have seen your eyes looking at me from a portrait of some Lady Lester in Charles II.'s time, ever since I was a little child.'

'And I knew your face quite well too, from the picture.'

'Have you seen it often, then?'

'Oh yes. Mr Ludlow is a friend of mine, and he painted me and Kitty in it.'

'Oh, Sage, how very extraordinary!—Yes, of course, that is partly how I know your face, though it is also from the Lester portraits. It really is a succession of the most wonderful coincidences—that I should have been painted without the artist seeing me, and under my very own name, and that my cousin should be painted in the same picture.'

'Do you know,' Sage said—she was recovering a little from the bewilderment into which Pomona's coming had thrown her—'do you know I was going this very afternoon to see Mr Ludlow? He has been away from London, and comes back to-day; and I was to have gone to tea with him, only the— the friend I was going with could not go.'

At Mrs Copleston's dinner party Maurice Moore had told Pomona that he knew Sage a little, and now Sage avoided mentioning his name. Well, well! it is no use going back on every lightly spoken word, and tracing to it the first hairbreadth deviation that ultimately alters the whole course of life. How should we ever dare to speak if we could calculate all the widespread effect each word may produce?'

'Where does he live?'

'In Regent's Park. It is a long way; we generally go by omnibus.'

'Yes.' For the first time Pomona felt a little bit shy. It seemed rather showy and pretentious to mention the carriage and nice pair of horses waiting outside. She would have liked very much to go with Sage in an omnibus, and to have appeared as if such means of conveyance were quite familiar to her.

'I should so like Mr Ludlow to see you,' Sage went on. 'You know he painted Pomona from his memory of his wife who died years ago; so you must be very much like her. He was so very fond of her, even now, after all these years, he keeps her little work-basket always beside him when he paints, and he is always thinking of her. I am sure it would be a great pleasure to him to see any one so like her. But, do you know, the likeness goes off after the first? I can see quite well now that it was not drawn from you. I can see'—

'Well, what can you see?'

'That you are far more beautiful.'

'What a flattering, little cousin it is, and looking so truthful, too, with those big, Lester eyes.—Sage, I must take you some day to see my mother. She is ill, you know, or she would have come herself; and the doctor has sent her off to Beechfield because London was too much for her. I wanted dreadfully to go too; but she would not let me. You will like her so, Sage—every one does, and she will be so fond of you. I shall dress you up one day in some of the old costumes up in the chest at home, and turn up your hair over a cushion and powder it. They dressed me up once like that for a fancy ball. I thought I should look like one of the old Lester portraits;

but I didn't one bit. They can't make a Lester out of me anyhow.'

'I want Mr Ludlow to see you.'

'Well, why shouldn't I drive home that way with you this afternoon? I should like to see him to.'

And so it was settled; and Pomona went up with Sage while she changed her dress, and sat by with that simple, sunny good-breeding that takes all sense of awkwardness away, so that Sage did not feel till afterwards that the room was shabby, and that Pomona's maid most likely had a better one, and that her cousin never had to hunt in a drawer for one thing and in a box for another, much less sew a button on her boot with her own hands.

They were just two girls together; and if Pomona criticised at all, it was rather to envy the greater freedom her cousin enjoyed without a maid fussing about and interfering, and the easy, picnic sort of existence of doing everything for one's self.

MODERN SAILING-SHIPS.

A MODERN sailing-ship replete with labour-saving appliances is a veritable triumph of the naval architect's art, and an excellent object lesson on man's power over the forces of nature. If Christopher Columbus could revisit our planet from the shades, he would doubtless be astounded by a critical comparison between the tiny wooden caravel with which he discovered a New World, and a leviathan four-masted steel sailing-ship, now navigated in comparative comfort to every possible port where freight is obtainable. Wooden cargo-carrying craft impelled by the unbought wind are surely diminishing in numbers; and in the near future it is not improbable that a stately sailing-ship will be as seldom seen on the waste of waters as a screw steamship was half a century ago. Even looking leisurely backward down the imposing vista of the last thirty years of the Victorian era, it will be readily perceived with what marvellous mastery iron and steel have supplanted, not only wood in the hulls, masts, and yards of sailing-ships, but also hemp in their rigging.

A radical revolution has been effected in the form, size, and construction of these cargo-carriers during such a relatively insignificant interval, and the end is not yet. The old-fashioned type of wooden merchantman remained practically invariable for more than a hundred years; but change is all-powerful at present, so that a vessel is almost of a bygone age before she shall have completed her maiden voyage. It would appear, however, that the limit of size has been reached. Ship-owning firms and shipbuilders will probably soon be compelled to keep the modern steel sailing-ship within more moderate dimensions. Vessels of exceptionally large carrying capacity are in demand owing to the fact that experience proves them to be the best kind for affording a fair return to the capital invested. Salvage appliances and docks do not keep pace with the requirements of such leviathans; so that underwriters evince an increasing dislike to big ships, and the premium for insurance rises accordingly, to compensate for extra risk.

Many mariners and some shipbuilders were at one time quick to express a pronounced opinion that it was quite unnatural for an iron ship to remain afloat. Wood was made to swim, but iron to sink, said these sincere but mistaken admirers of the good old days. Their misgivings have proved to be without foundation in fact, for iron ships have ousted wooden craft almost utterly from the ocean-carrying traffic. Iron has also reached its meridian altitude, and steel is rapidly rising above the horizon of progress. The ship-building yards of Nova Scotia, Canada, the United States of America, and British Columbia, however, still launch wooden sailing-vessels, although in decreasing numbers, and, as a rule, of inconsiderable tonnage.

It seems scarcely credible that only as recently as 1870 there were not more than ten sailing-ships afloat of two thousand tons register and upwards under the red ensign of the British mercantile marine. To-day we have more than that number of splendid steel sailing-ships, each having a register tonnage in excess of three thousand. During the twelve months of 1892 there were turned out from one yard alone on the Clyde, that of Messrs Russell & Co., no fewer than thirteen huge sailing-vessels, varying in register tonnage from two thousand three hundred to three thousand five hundred! One of the largest wooden sailing-ships afloat in 1870 was the 'British Empire,' of two thousand seven hundred tons register, which, under the command of Captain A. Pearson, was an ark of safety to the families of European residents in Bombay during the Indian Mutiny. She had been originally intended for a steamship, and this will account for her exceptional dimensions. The shipbuilding firm of A. Sewall & Co., of Bath, Maine, U.S.A., have probably launched the largest wooden sailing-ships. In 1889 they built the 'Rappahannock,' of 3054 tons register; in 1890, the 'Shenandoah,' 3258 tons; in 1891, the 'Susquehanna,' 2629 tons; and in 1892, the 'Roanoke,' of 3400 tons register.

Several cities claim to be the birthplace of Homer, and there exists similar rivalry with respect to the first iron ship. This at least is certain, that the first iron vessel classed by Lloyd's was the British barque 'Ironsides,' in 1838. She was but 271 tons register; and we shall proceed to indicate the gigantic strides that have been made since then in iron and steel shipbuilding. The Clyde stands *facile princeps* in this most important branch of industry. Vessels built on the banks of that river are rendering a praiseworthy account of themselves on every sea and under every flag. A concise statement of last year's output will serve our purpose admirably. Messrs Russell & Co. launched twenty-six large steel sailing-ships, or exactly one a fortnight, having an average register tonnage of 2086. The smallest was 1400 tons, the largest 3500. Messrs Barclay, Curle, & Co. completed five, averaging 2373 tons; Messrs Duncan & Co., five of 2348 tons; Messrs Scott & Co., three of 2250 tons; Messrs Mackie & Thomson, two of 2825 tons; Messrs Hamilton & Co., five of 2095 tons; Messrs D. & W. Henderson, one of 2386 tons; Messrs Stephen & Sons, one of 2086 tons; Messrs Connell & Co., twelve of 1980 tons; Messrs Rodger & Co., seven of 1674

tons. At Leith, Messrs Ramage & Ferguson launched one of 3137 tons; on the Tay, Messrs Thompson & Co., one of 2942 tons; and Messrs Stephen & Sons, one of 2857 tons register. Germany built three similar ships during the year, having a register tonnage of 2400, 2700, and 2895 respectively. No other country launched any iron or steel ships of 2000 tons register or above, but preferred to obtain them from our shipbuilding yards. The so-called protection of native industry principle prevailing in America precludes ship-owners over there from taking advantage directly of the cheapest market. Several of the large sailers, however, built on the Clyde in 1892 were for citizens of the United States, but are necessarily sailed under the British, Hawaiian, or some flag other than that of the country to which they actually belong.

Several of the brand-new sailing-ships specified above have been lost or seriously damaged within a few months of their launch. The 'Thracian,' 2154 tons register, was capsized in a heavy squall off the Isle of Man while towing round in ballast from the Clyde yard to Liverpool in order to receive her first cargo. Not one of her crew was saved, as the vessel and all hands disappeared so suddenly that help from the tugboat was impossible. The Shipmasters' Federation called upon the Board of Trade to inquire into the cause of this appalling catastrophe, but without avail. The 'Crown of Austria,' 3137 tons register, would not answer her helm properly while making a passage, went ashore on the coast of Brazil, and became a total loss. A fire broke out on board the recently launched barque 'Auchmountain,' as she lay at anchor ready to sail on her first voyage, and she blew up in a few hours, the fire having reached some explosives in her cargo.

The number of seamen carried per one hundred tons in the modern four-masted sailing-ship is cut down to the uttermost limit consistent with safety; and, as a consequence, dismasting and tedious passages are not infrequent. The 'Hawaiian Isles,' 2097 tons register, a United States ship under a foreign flag, bound to California with a cargo of coal, found it impossible to weather Cape Horn by reason of violent westerly gales. She was turned round, ran along the lone Southern Ocean, before the 'brave west winds' so admirably described by the illustrious Maury, now gathered to his rest, and eventually reached her destination by the route leading south of Australia. She was one hundred and eighty-nine days on the passage, and no fewer than sixty guineas per cent. had been freely paid for her re-insurance. A similar ship, the 'John Ena,' carrying a substantial cargo of 4222 tons of coal from Barry to San Francisco, also encountered bad weather, made a long passage, and twenty guineas per cent. was paid on her for re-insurance. Another new ship, the 'Achnashie,' 2476 tons register, got into still more serious difficulty under like circumstances. She had to put back to Cape Town, damaged and leaky, after attempting in vain to contend against the bitter blast off Cape Horn. There, her cargo was discharged, and she went into dry dock for the absolutely necessary repairs. The 'Austrasia,' 2718 tons register, was almost totally dismasted near the island of Tristan da Cunha, in the South

Atlantic, on her maiden passage, while bound from Liverpool to Calcutta with a cargo of salt. By dint of sterling seamanship she was brought to Rio Janeiro in safety, returned to Liverpool under improvised masts, discharged her cargo, refitted, took in quite a different cargo at London, and sailed for California. The 'Somali,' 3537 tons register, the largest sailing-ship launched in 1892, has been dismasted in the China Sea. Everything above the lower masts had to be made for her on the Clyde; yet, within fifteen days of the order being received by Messrs Russell & Co., the spars and gear were completed and shipped for passage to the 'Somali' at Hong-kong. Underwriters suffer severely with such ships.

Then, again, coal cargoes of about four or five thousand tons seem specially liable to spontaneous combustion. The 'King James,' 2305 tons register, bound from New South Wales to California with coal, was compulsorily abandoned from this cause, and only a few of her crew were rescued after enduring terrible privations in open boats. Another of these leviathans, the 'Cedarbank,' 2825 tons register, met with a precisely similar misfortune on the same route. Fortunately, however, for all concerned, the fire was successfully kept under until she reached San Francisco, although there had been several slight explosions in the meanwhile.

All the above-mentioned ships were launched in 1892; but several vessels of huge dimensions, launched just previously, have also come to grief. The 'Honresfeld,' with 4570 tons of coal; and the 'Rappahannock,' with 3990 tons, have been totally destroyed by fire. Several others of about the same tonnage have had their coal cargoes dangerously heated. The 'Durkerque,' 3094 tons; the 'Perseverance,' 2511 tons; the 'Nation,' 2401 tons; the 'Romsdal,' 2000 tons; the 'Ashbank,' 2174 tons; and the 'Eleanor Margaret,' 2327 tons register, have all disappeared, without leaving a trace, as utterly as though they had never been. Better seamanship is required to-day than ever before from masters and officers of these large floating warehouses, exposed to danger both from within and without.

Auxiliary steam-power was once used for the purpose of forcing a sailing-ship through regions of calms and light variable winds, but proved a dismal failure. The marine engineer has not been idle since that day, with the result that increased steam-power is now possible by the employment of smaller engines at a decreased coal consumption. Cargo-space being gained and expenses lessened, ship-owners have been tempted to give this auxiliary screw system another trial. The 'Maria Rickmers,' an enormous five-masted sailing-ship, built on the Clyde for the large Bremen firm of Messrs Rickmers, was thus fitted, and gave rise to great expectations quite recently. She carried nearly 6000 tons of coal from Barry to Singapore, apparently not without grave danger from dismasting or capsizing in a heavy squall, and utterly disappeared with all hands and a cargo of rice on her first homeward passage from Saigon. The forebodings of seamen were in this instance only too well founded. It was wrong to expect that the small crew could handle so large a ship in a case of emergency. A smaller auxiliary barque, the 'Severn,' an American

vessel under British colours, also built on the Clyde, has so far fared well; but the growing tendency of the age is to keep sail and steam quite apart. Twin screws and pole masts are the order of the day.

The largest sailing-ship afloat is the French five-master, 'La France,' launched in 1890 on the Clyde, and owned by Messrs Ant Dom Bordes et Fils, who possess a large fleet of sailing-vessels. In 1891 she came from Iquique to Dunkirk in one hundred and five days with 6000 tons of nitrate; yet she was stopped on the Tyne when proceeding to sea with 5500 tons of coal, and compelled to take out five hundred tons on the ground that she was overladen. There is not a single five-masted sailing-ship under the British flag. The United States has two five-masters, the 'Louis' of 830 tons, and the 'Gov. Ames' of 1778 tons, both fore and aft schooners, a rig peculiar to the American coast. Ships having five masts can be counted on the fingers of one hand; but, strange to say, the steamship 'Coptic,' of the Shaw, Savill, & Albion Co., on her way to New Zealand, in December 1890, passed the 'Gov. Ames' in fourteen degrees south, thirty-four degrees west, bound for California; and two days later, in six degrees south, thirty-one degrees west, the French five-master, 'La France,' bound south. Passengers and crew of the 'Coptic' might travel over many a weary league of sea, and never again be afforded two such excellent object lessons in the growth of sailing-ships in quick succession. The largest three-masted sailing-ship is the 'Ditton,' of 2850 tons.

Sailing-ships sometimes spend long intervals at sea without raising a sail of any kind above their ever-changing horizons. Hence the unique experience of the 'Lorton' and the 'Cockermouth' is well worth recording. They left Liverpool together; and arrived at Astoria, Oregon, within forty-eight hours of each other. Throughout this long passage of over fifteen thousand miles they were not widely separated at any given instant, and for forty days were actually in close company. Captain Steel and his family of the 'Lorton' went dine on board the 'Cockermouth' on one Sunday; and Captain McAdam and his wife of the 'Cockermouth' would pay a return visit to the 'Lorton' on the following Sunday. Life might be made more worth living on sailing-ships, remote from the land, were such an interchange of courtesies always possible.

Some large sailing-ships experience a decided difficulty in obtaining freights that will repay expenses, even ignoring a margin for profit. At San Francisco the 'Agenor' waited for a cargo from October 1891 to July 1893. The 'Auchencairn' arrived at that port in March 1892; the 'Argo,' 'Bothwell,' 'Dunfermline,' and 'Glenlui,' in February 1892; the 'Bardowie' in January 1892; and the 'Netherby' in April 1892. Not one of these ships had obtained a charter up to the commencement of July 1893. Shareholders will scarcely find that shipping is a remunerative investment. At times, however, the charterers stand to lose considerably. Two British ships, the 'Minister of Marine' and the 'Alexander Yeats,' arrived at Manila in 1889, under a charter to load hemp. The charterers speculated for a falling market, which did not happen, kept the two ships idle in port for nearly ten months,

and eventually sent them home with sugar cargoes under new charters. The claims for demurrage were paid regularly to the shipmasters day by day, in accordance with the law, and reached the following exceptional amounts: 'Minister of Marine' £5028; 'Alexander Yeats,' £4986. On the other hand, in ordinary circumstances, both loading and unloading are carried out with a celerity that defies description. Not long since, the 'Commonwealth,' a sailing-ship from San Francisco, discharged 3000 tons of golden grain at Liverpool, and was ballasted ready for sea again in twenty-seven hours. Last June the 'Cressington' took in a full cargo of 3180 tons of coal at Newcastle, Australia, and sailed for Valparaiso, having occupied only fifty-three hours from the time of entering port till her loading was completed. Nevertheless, we are reluctantly compelled to confess that the days of sailing-ships are almost numbered. The cry for huge sailers is an evidence that steam is determining the dimensions of the most modern cargo-carriers under sail.

A MESSAGE FROM THE DESERT.

CHAPTER II.

THE Pattens came of a squatting family. The father had been the owner of a compact and paying sheep station in the south-west of New South Wales. He died shortly after the death of his two sons in Queensland; and the youngest son, who had lately visited Bendabar, now held possession of the property, owning a half-share, and managing for his mother and two younger sisters who inherited the other half.

It was some three months after his northern visit, and he sat in the small veranda room that did duty as an office, regarding a letter he had just received from New Zealand. The letter was from Hopwood, in reply to one from Patten, Hopwood having forwarded his address on seeing the advertisement that had been inserted. The writer described the position of the place to the best of his memory, but candidly stated that, after such a lapse of time, and the alteration entailed by cutting the timber, and the effect of the flood, he did not suppose he could do more than go approximately near the spot, even if he visited the locality.

From Jim Turner there had been no response; and Patten moodily thought that his only plan would be to go back and turn up about half a mile of the bank; and even then, with the utmost care, such a small article as a salmon tin might easily be missed.

The whole affair had an atmosphere of mystery about it that was depressing. In the first place, Burgess, when he returned, had managed to evade a personal interview. Both Patten and his father had been naturally anxious to see him, and hear from his own lips the account of the tragedy; but although Burgess had written several letters, he always managed to miss any appointments, and finally disappeared without leaving any address. Young Patten was then bent upon going up to Queensland and personally searching for the remains; but his father was breaking up—he could not be spared from the station; and

so he had perforce to remain until it was too late to do any good.

The years rolled on, and he had almost forgotten the fancies that had troubled him when he first heard of the catastrophe. He and his half-brother, who was the only child of the first wife, had always mutually disliked each other, and Robert Patten, the younger, had strongly objected to his brother's going on the trip. The eldest son had always been of a morose, passionate nature, and had systematically bullied his young half-brothers until they were old enough to resent it. This, the youngest one, did more than his brother, who was of a quieter disposition. In consequence, it was with rather a prejudiced mind that Robert now turned over the various circumstances that had lately cropped up concerning the deaths in the west of Queensland.

In the first place, he had met an old friend, who said to him: 'By the way, I always understood that your eldest brother died in the bush in Queensland.'

'So he did, I am sorry to say.'

'Well, I saw either him or his ghost in Adelaide about two years ago.'

'Nonsense, man!—a case of mistaken identity.'

'It is *you* who are talking nonsense, my boy. Why, I know your brother Alf Patten better than I do you.'

'Did you speak to him?'

'No. In fact, to tell you the truth, he seemed to avoid me.'

'It must have been a ghost, then.' If it had been my brother, why should he have avoided you, and why has he not come home?'

'Well, it was a wonderful likeness. I was on my way home to England at the time; and I certainly told several people on board, who knew him and had heard of his death, about it.'

Patten was naturally disturbed by such a piece of information. If his brother was alive, he owned the whole of the station, and all the property left by his father, for the will, made shortly before his father's death, only left it between his mother, sisters, and himself, contingent upon the deaths of his two brothers being confirmed; for, owing to the strange reluctance shown by Burgess to a personal meeting, the old man had been impressed with the idea that Burgess had deserted his companions, and, in reality, knew nothing of their fate. Under these circumstances, why should his brother stay away, if alive?

Not many weeks after this, the letter from Burgess arrived, enclosed in one from a brother, stating that the writer was dead, and had requested that on his death the enclosed should be forwarded as directed. Burgess in his letter merely said that he had buried certain papers belonging to his brother confided to his care, and gave a description of the place. He made no explanation of his motive for concealing the papers, nor for his conduct in avoiding an interview, but wound up with the ominous sentence: 'In those papers you will find the true account of your brother's death.' It was noticeable that he only referred to one brother, although he had stated to everybody that both were dead.

Patten mused dejectedly for some time, then wrote a short letter to Hopwood, thanking him for his letter.

'Blanche,' he said that evening to his eldest

sister, whom he had to a certain extent taken into his confidence, 'I have already told you that I have reason to believe that Alf is still alive. Now, I want you to communicate this belief to the others, for I should not be surprised to see him turn up any day.'

'Surely, Bob, you have not heard from him, have you?' she returned, in surprise.

'No; but I have reason to think that the only obstacle to his reappearance has been removed. If he is alive, as I believe, I am pretty confident that we shall see something of him shortly.'

'But it will make an awful difference to you, will it not? In the station, I mean.'

'Certainly; it all belongs to him. Our mother will have a third by law, which will be enough for her and you girls; but I shall be asked to leave, you may be sure, as soon as Alf comes in possession. Fortunately, I have made a little money on my own account during the last ten years, so shall not be quite penniless.'

His sister left him; and Robert remained smoking on the moonlit veranda. Like a flash of light, it had suddenly illumined his mind that the reason Alf did not reappear was because of Burgess. Once he heard of Burgess's death, he would not hesitate to come and claim his heritage. There was now no doubt in his mind. Burgess had been either a witness or accomplice in some deed that would not bear the light of day.

He turned to go inside the house, when the tread of a horse approaching made him look round. Instinctively, he knew who was coming—the supposed dead man had returned to his own place.

In the bright clear moonlight he easily recognised the rider, who dismounted, and hung his bridle on the picket fence that surrounded the garden, then approached the gate that led to the house.

Robert called to his sister: 'Blanche! our expected visitor has come; and strolled down the path to meet his half-brother.'

'Well, Bob,' said the latter as they met, 'I suppose you hoped never to see me again?'

'On the contrary, Alf,' said Robert quietly, 'I have been expecting you for some time. What have you been keeping up this farce so long for?'

'That I will tell you presently. Are we to go back on the old terms, although ten years have passed? Have you got neither word nor hand to welcome a fellow?'

'Let's have a mutual explanation first, both with regard to Sam's death and your silence.'

'Very well. Evidently, you are not pleased at the boss coming home. Will you tell one of the fellows to turn my horse out? and then we will see if the others of you are a little warmer in their welcome.'

Robert called one of the men, who took the horse; and the two men entered the house.

Mrs Patten and the girls received the wanderer with at any rate an assumption of cordiality. They knew nothing of the graver doubts that tormented their brother, and, with womanly tenderness, endeavoured to make the unexpected arrival feel that he was welcome to his own home. The ten years of absence had not altered him much, save that, to Robert, he seemed coarser and rougher in his manner and conversation, as though

his time had been passed amongst inferior associates.

He at once told his stepmother that he was going to have a long talk with his half-brother, and explain his absence; and taking the hint, the women soon retired and left the two men together. Both smoked in silence for a while, then Alf suddenly remarked: 'What did that hound Burgess say when he got in?'

Robert had anticipated the question. He handed his brother one of the old newspapers containing the printed account.

The other read it through in silence. 'A tissue of lies, with a word of truth here and there,' was his comment when he came to the end. 'How did you think I was alive, after such a statement as that?'

'Old Broadhurst saw you in Adelaide over two years ago.'

'Did Burgess tell you any more than he has done here?'

'I never saw him. For some unaccountable reason, he dodged me always, and I could not get a personal interview with him.'

'Now I will tell you what really happened,' said Alf. 'In the first place, the statement that we were successful in getting beyond the South Australian border for some distance is true. On our return, we camped near a patch of poison-plant, and lost a number of our horses. That also is true.'—

'The bones of the horses have been found,' interjected Robert.

'But no human remains?' said the other, somewhat hastily.

'No.'

'Of course, because there were none to find—at least, there. We got on to a dry stage, and found the water we depended on, dry. That is true. Now come the lies. We stopped at that dry hole, dead-beat, and debated what was best to be done. Before us were about fifty miles of dry country, and at the end of it, an uncertainty. Behind us were thirty miles of dry country and the water we had left, a certainty. We decided to turn back after taking a few hours' rest. We had only five horses left. Two of them were fairly strong, and the other three weak and knocked up. That night, while we slept, Burgess sneaked off with the two strong horses and nearly all the water and rations, and left us to our fate. No wonder he would not meet you.'

Both men were silent after this disclosure.

'What happened then?' said Robert at last.

'When we awoke and found Burgess gone, we could do nothing but tramp back to the water we had left. There we arrived more dead than alive, with two out of the three horses, the other one having died on the road. We decided to make for the Overland Telegraph Line. This, to make a long story short, eventually we did; but I was the only one who reached it. The black boy died, I cannot say of what. He gave in, and lost pluck. Sam was speared by the natives on a creek about a hundred miles east of the line, and died in about an hour. We had used up every cartridge when they tackled us, or it would not have happened.'

Robert started at these words, for they seemed such an echo of the story told by Burgess; and yet, according to this version, Burgess could have

known nothing of the fate of the men he deserted.

'I got to the Line, and luckily came across a repairing party, and they took me in to Barrow Creek Station.'—

'And with the telegraph right at your hand, you never wired our father a word of either Sam or yourself?' interrupted Robert.

Alf got up, and impatiently walked about the room. 'To tell you the truth, I had not the heart. I blamed myself right through. I had no business to persuade Sam to come and risk his life. I would rather you thought us both dead, than have to come home alone; I felt that I had been the cause of his death.'

'What did you do then, Alf?'

'We had seen some good country on our way across; and when I got down to Adelaide, I took up the lease of it and sold it very well. I fell in with some men going to South Africa; and as I had a roving fit on me, I joined them, and was there five years. I volunteered for the Zulu War, and saw a good deal of it. Then I came back to Australia, and went up to the gold rush at Kimberley. Everywhere I did well, just because I did not particularly want it, I suppose. At last I got tired of knocking about, and determined to come home and declare myself. I may as well tell you that I had seen the notice of the old man's death in a Sydney paper; and you know as well as I, do that after his death there is not a soul here who would not prefer that I had never returned. I am not, and never was, a favourite with my father's second family. As it is, I suppose that I appear to oust you; but I have no intention of doing so. There is enough for us all. I could never play the part of the modern squatter.'

'It is late, Alf,' said Robert, rising. 'I have much to think of. Believe me, that nobody here is sorry to see you back; but you must admit that your silence and absence under such circumstances as the death of Sam were peculiar. Is it not so?'

'Perhaps; but I presume you are satisfied as to my own identity?—Tell me,' he went on, as his brother halted for a moment at the door, 'has little Kate Rudder grown up as pretty as she promised to be?'

'Miss Rudder,' returned Robert coldly, 'has grown up as pretty and good as she promised to be.—Now, good-night. Your old room is ready for you; you know the way.' He closed the door almost as he spoke.

Left to himself, Alf smiled somewhat grimly. 'I touched Master Bob on a tender spot, seemingly. Evidently he has his eye on Kate Rudder.' He turned the lamp out and went to his room.

It was quite true Alf Patten had touched upon a tender spot when he mentioned Kate Rudder's name to his brother. The Rudders owned the neighbouring station, and the two families had always been on the most friendly footing. Kate, the youngest, and only unmarried girl, was now a brilliant and beautiful young woman of one-and-twenty, with half-a-dozen aspirants for her hand. Robert was sorely smitten, and had reason to believe that he had some chance of success; but his brother's remark gave him some troubled thoughts that night. Robert Patten, the owner of half the station and a good deal of other

property, and Robert Patten beginning life afresh on a small and limited capital, were two very different men. He had no reason to think the girl mercenary or capricious; but his nature had a warp of distrust in it which often led him to suspect the motives of other people without cause; and in the present instance influenced him against accepting the liberal speeches of his returned relative without large discount.

TATTERED VOLUMES.

THE manner in which books are regarded by literary workers is a somewhat curious subject, and a short account thereof may possibly prove not uninteresting.

Among those who have won more or less fame by the pen may be counted many different specimens of the book-lover, from the genuine bibliomaniac to the voracious and tasteless reader who regards a book as mere leather and paper—a collection of material for the acquisition of knowledge. It is scarcely necessary to remark that there is often a wide discrepancy between a man's tastes and desires and their fulfilment. Many a book-lover lacks the wherewithal to approach in any way to his idea of a suitable covering for his favourite volumes. Sometimes one has to turn amateur bookbinder. Even Southey occasionally bound a volume himself. He once presented a copy of his 'Madoc,' in quarto, to a neighbour and friend in the Lake District, and the volume is still in existence, with the following inscription:

Mr Stranger, from the author.
This book, binding and all,
Is the handiwork of Greta Hall.
R. S.

Leigh Hunt, speaking of Matthias Corvinus, who bound his books in vellum and gold, says: 'Not being a king of Hungary, nor rich, nor having a confessor to absolve us from sins of expenditure, how lucky is it that we can take delight in books whose outsides are of the homeliest description! . . . We should have liked to challenge the majesty of Hungary to a bout at bookbinding, and seen which would have ordered the most intense and ravishing "legatura," something at which De Seuil or Grolier himself should have "sigh'd and look'd and sigh'd again;" something which would have made him own that there was nothing between it and an angel's wing. Meantime, nothing comes amiss to us but dirt or tatters, or cold, plain calf, school binding—a thing which we hate for its insipidity and formality.'

Charles Lamb, careful enough as to the insides of what he called his 'midnight darlings,' was unable to clothe them all in decent attire. In his delightful 'Detached Thoughts on Books and Reading,' he says in his quaint and paradoxical style: 'To view a well-arranged assortment of blockheaded Encyclopædias (Anglicanas or Metropolitanas) set out in an array of russia or morocco, when a tithe of that good leather would comfortably recloth the my shivering folios; would renovate Paracelsus himself, and enable old Raymond Lully to look like himself again in the

world. I never see these impostors but I long to strip them, to warm my ragged veterans in their spoils.' Yet he contended that 'in some respects the better a book is, the less it demands from binding.' Crabb Robinson describes the library of his friend the 'gentle Elia' as 'the finest collection of shabby books I ever saw; such a number of first-rate works in very bad condition is, I think, nowhere to be found.' On being once asked how he knew his books, Lamb replied: 'How does a shepherd know his sheep?'

Burton, in his 'Book-hunter,' gives an amusing account of De Quincey's famous collection of books. 'Some legend there is of a book creditor having forced his way into the Cacus den, and there seen a sort of rubble inner wall of volumes, with their edges outward; while others, bound and unbound, the plebeian sheepskin and the aristocratic russia, were squeezed into certain tubs drawn from the washing establishment of a confiding landlady.'

The famous reviewer Jeffrey treated with disdain the bookbinder's delicate art. Books were merely meant to be read, he contended, and he was quite satisfied so long as the words were visible. Lord Cockburn laments the fact that Jeffrey's library was, 'for a lover of books, and for one who had picked up a few, most wretched; and so ill cared for that the want even of a few volumes never disturbed him.' Carlyle, in his *Reminiscences*, describes the study of his brilliant countryman as 'a roomy, not overneat, apartment on the ground-floor, with a big baize-covered table loaded with book-rows and paper bundles. On one, or perhaps two, of the tables were book-shelves, likewise well filled, but with books in tattery, ill-bound, or unbound condition.'

It is pleasant to find that a greater Scotsman than Jeffrey, Adam Smith, paid particular attention to the outsides of his books, and sought relief from his researches into the mysteries of the 'dismal science' in the choice of leather and decorations. 'I am a beau,' was his remark, 'in nothing but my books.'

Jeffrey, in describing his introduction to Scott, says he found him 'in a small den, on the sunk floor of his father's house in George Square, surrounded with dingy books.' From what has already been said of his own library, it would be interesting to know the exact meaning he attached to the word 'dingy.' Years afterwards, Lockhart thus described Sir Walter's collection: 'The walls were entirely clothed with books, most of them folios and quartos, and all in that complete state of repair which at a glance reveals a tinge of bibliomania.' He also adds that 'the old bindings had obviously been retouched and regilt in the most approved manner; the new, when the books were of any mark, were rich, but never gaudy—a large proportion of blue morocco—all stamped with the device of the portcullis, and its motto, "Clausus tutus ero"—being an anagram of his name in Latin.'

It was Burton's opinion that in this respect 'poets are apt to be ragamuffins.' Wordsworth holds a high position in the ranks of those gentry. His library was once described as 'the most wretched thing that ever went by the name—a mere litter of tattered old volumes on a few shelves.' De Quincey, by no means inclined

towards bibliomania, describes the books of the great Lake poet as 'ill-bound or not bound at all—in boards, sometimes in tatters; many of them imperfect as to the number of volumes as well as mutilated as to the number of pages.'

James Thomson also belonged to the brigade of ragamuffins. It is said that he used to cut the leaves of books with his snuffers. There is a good story of the poet in Burton's Book-hunter, which deserves to be given at length. 'He had,' says Burton, 'an uncle, a clever, active mechanic, who could do many things with his hands, and contemplated James's indolent, dreamy, "feckless" character with impatient disgust. When the first of the "Seasons"—Winter it was, I believe—had been completed at press, Jamie thought, by a presentation copy, to triumph over his uncle's scepticism; and, to propitiate his good opinion, he had the book handsomely bound. The old man never looked inside, or asked what the book was about, but, turning it round and round with his fingers, in grateful admiration, exclaimed: "Come, is that really our Jamie's doin' now?—Weel, I never thought the cratur wad hae had the handicraft to do the like!"'

Goldsmith was as careless with his books as with his money; and though his library at one time contained many curious and rare books, he never hesitated to tear out a leaf to save either time or trouble. Sir John Hawkins relates how, when engaged on his historical researches about music, Goldsmith told him some curious things one night at the club. Hawkins asked him to put them in writing, and promised to call for them. Of course, Goldsmith was not ready when his friend called, but he quickly took down a book and tore out six leaves containing the information. In Mr Austin Dobson's poem, 'The Book-plate's Petition,' is the following reference to another great man who was occasionally rough on books:

This was a scholar, one of those
Whose Greek is sounder than their hose;
He loved old books and nappy ale,
So lived at Streatham, next to Thrale.
'Twas there this stain of grease I boast
Was made by Dr Johnson's toast.

A CHRISTMAS AT THE RIDGE HOUSE.

WE were just four at the Ridge House: Richard Hardy (that is my father); John Warne, my husband; the two-year-old babe called 'Little Dick'; and myself. The Ridge is a desolate place: it is just a bank of sand and shingle, some eight or nine miles long; in front, there is the sea; and behind the house, the river and the marshes. In winter-time the marshes are often flooded, and then there seems to be naught but water all round one. I have lived there nearly all my life, for my father has been tideman many a long year. Just by our house are the flood-gates; and when the water in the marsh dikes is above a certain height, we have to open the gates at the ebb-tide and let the water down through a great iron pipe into the sea. But the gates must be shut ere the flood-tide runs back, for that is higher than the marshes; and if once the salt water ran through, all the good grass would be rotted; not to speak of what

might happen in rough weather if once the strong waves began to run through to the land-side of the Ridge.

It was two days before Christmas; we had had a frost; but the ice was melting now, and we knew well the water would soon run down from inland over the marshes. It comes a deal quicker, since all the drain-pipes have been laid down in the fields.

'John,' said my father that Monday morning, 'if ye want aught from the village, get it to-day against Christmas. There is a storm coming.'

So John went in with the great basket; and well it was he went then, for the wind had risen ere he came back; and weary work it was for him to carry the heavy basket along the five miles of Ridge; and the wind grew higher after.

At ebb-tide, father and I went out to let the water off. Oh, it had risen more than I could have believed! It must have been snow-water from the hills. I never saw it so before or since. We opened the big gate; but when the water began to go through, all the ice came up in great blocks and fared to fill up the way; so we had to get a rake and pole to keep it clear. When we were hard at work, who should come by but Wilkins, the man that lives in the watch-house two miles on. He was not much of a neighbour then. I had said him 'Nay' afore I married John, and he wasn't one to forget. But that day, as I saw him pass, I was thinking just of the babe left all alone in bed, and I called to him to lend father a helping hand while I ran round to the house.

'I've got but two hands,' said he; 'and they're for my own work;' and with that he passed on.

'Never mind, Mary,' said father. 'You go to the babe; that is what is right.'

I suppose I was right; but in I went, right or wrong, and gave the boy his dinner and put the fire to rights; then John came in, and I sent him round to father, for the ice frightened me; I could hear it crashing and groaning from the house.

Just after John went out, I heard him call. Father, poor dear, had got tired, and had sat down all hot as he was; and now he was set hard and stiff with the rheumatics. Oh, the job we had to get him home and to bed; and there we had to leave him, for the tide was running in, and John could not shut the gates without me to keep the ice back. I thought it a dreadful time, not knowing that worse was coming.

When the gates were shut, I went in and sat by father. He looked very bad, and in my heart came hard thoughts of Wilkins. Why couldn't he have stopped and saved the old man from doing more than his strength could bear?

John went to bed for a bit, for we had a long night's work before us at the ebb-tide; and I lay down; but I couldn't sleep, the wind howled so. Little Dick was frightened too, but only held my hand, and didn't cry, for I said, 'Father's asleep.' There never was so good a babe! By-and-by he fell asleep; and when we had to go out, I just laid him on his grandfather's bed. Father looked a little better, and I gave him a hot drink before I took the lantern to start. It was a job to stand against the wind;

but that wasn't what made John stumble; it was a great log that used to lie down by the pipe-mouth.

'Mary,' said he—and his voice shook—'the sea's never been up here.'

'Heaven help us!' said I, 'if it has, for to-morrow's the spring-tide, and where will it be then?'

I tied the lantern up against the gate. The flood had risen higher than ever. It was terrible work keeping the ice back; but we felt as if we were working for our lives; for if the flood rose much higher, it would be almost over the bank; and with another high tide the waters would meet, and where would Ridge House be then?

The water ran through better now, and John said directly the gates were shut, he would go round to the village for help against the next tide. But when we came to slide the gate, it wouldn't stay. One of the great iron holds was gone—cracked through by the frost, and knocked off by the ice, I suppose. John held the shutter while I went back for bolts and screws. No one can know what it was like doing up that gate! We were both obliged to be half in the icy water; and the sea came roaring up the great iron tunnel, and we had only the lantern for light in the dreadful howling darkness. When it was done at last, we crawled back to the house; we were all drenched, and almost frozen. John made me change my clothes, and then I threw myself down on the bed and slept. I seemed to have only been asleep a moment, when I awoke at the sound of voices. It was daylight. John and father were talking. Father said he had heard the water against the house in the night. John went down to open the gate and look for the tide-marks, while I got the breakfast and dressed the child. Father managed to get up, and I didn't stop him, for I couldn't bear to think of his lying in bed to be drowned, if it came to that. I kissed Dick quite gently; but I felt mad at heart; and when father tried to teach him the Christmas words, I went out to John, for I couldn't bear it. What peace was there for me, and my child going to be drowned?

I told John I must go to the village—it was seven miles, but I thought I could get there. It was no use, however. When I had gone a few hundred yards, I got on to the loose sand, and having no foothold, I was blown down over and over again, and could only come back. When it was time to shut the gate, I tried to do it, while John stayed to stop the ice; but I couldn't stir it as we had done it up, so John had to do it for me, it moved so stiffly. Then we went in. The sea kept rising. Father prayed. I sat by the fire, and John walked about the room. There was no good in his going for help now, for this was the time of need. All at once he stopped in front of the window. 'Where's the watch-house?' said he; and well he might, for it was gone! It had been a little black house, built on a bit of bank between the Ridge and the great dike. Nothing was there now but foaming water, for the flood was rough like the sea.

'Wilkins must be drowned,' said John.

'Serve him right; and a good thing too,' said I. I felt quite mad.

John got his glass. 'I see him,' he said; 'he's on a spar. The house can't have gone long;' and with that he went to the door.

I went after him. As I expected, he was turning over our little punt. 'What are you going to do, John Warne?' I said, hard and cold. 'Who is to move the flood-gate? for I can't;' and I pointed to the icy water. 'You will never get back across the water; and if the gates stay shut, this house will be gone ere night.'

He turned round like one struck dumb and went into the kitchen.

Father looked at us both and said nothing. Then John did a strange thing—he cried. I'd never seen him cry before, and it frightened me. Then I spoke. 'John,' I said, quite gently, 'you can't go, for the sake of the lives here, and maybe those up country in the "lookers" cottages. But though I said "Serve him right," I'll go, not for Wilkins' sake, but for yours, John.'

Then John got up; but father stopped him; and I just kissed them all, and ran out, and pushed the boat into the water all in a minute, for I feared John would go after all. And as I put off, John came out, looking all stunned with trouble and the cold. After that, I had enough to do keeping the boat from the ice. I had the wind with me; and in about half an hour I got to where Wilkins was still clinging to the spar. I thought of his words about his two hands being for his own work, and I felt quite savage again. But when I got up to him, I helped him in, and dangerous it was. I thought the boat would have been over. Then I wrapped him up in a long piece of herring-net out of the locker, and turned to go home. While I was settling Wilkins, the boat had drifted on; and when I turned her head round, I found it was a very much harder thing to go back against the wind than it was to come with it. I was tired out, too, you see; and I began to wonder whether the tide was in. The spray was flying in great sheets over the Ridge; but every now and then I caught sight of our house, a black speck in the distance.

I pulled; but I didn't seem to make way; the ice kept coming up against us. At last the boat got stuck fast in a great ice-sheet, and I couldn't move her any way. I drew the oars in, for there was nothing to be done; the ice was too thick to break round the boat. The wind blew us on, boat and ice together, round the bend of the Ridge. I couldn't see our home now, and I didn't know what might be happening there. Wilkins lay white, and like one dead, at the bottom of the boat. Perhaps he was dead, and I had done no good after all.

And then John and Dick and father, they'd never been in trouble before without me with them; but what could I do now? Then I thought of father praying, and I prayed. I don't know what I said, and I don't think I said much. The cold seemed getting greater, but I seemed fading away from the cold and trouble. I fancied, somehow, through it all I was going into 'Christmas peace.'

I must have slept a long time: when I woke, John was standing over me; people were rubbing my hands; some one poured brandy down my throat. I had been all but frozen to death!

When I opened my eyes, John cried again; he

was weak with the toil and trouble; but now we could rest, for the men had come from the village—six of them. John had walked across that rotten ice with a rope, and somehow they had got the punt ashore. They carried us back, for Wilkins was worse than I was, though not dead; and now the wind had dropped, for the frost had come back; and as we went along the Ridge, I heard the bells ringing inland. 'Joy-bells' for Christmas! They were joy-bells for me, for those at home were safe. Nigh washed away, they had been; but the wind fell just in time to save them.

'Thank God!' said father; and so said we all.

The great folks since then, they have made a deal of my going for Wilkins; but I said to John: 'You were the bravest, for you wanted to go when I didn't; and then you let me go, which was harder than going yourself.'

And he said: 'I don't know, lass, that I should have let you go if I had been quick enough to stop you.'

WINGLESS BIRDS.

By FRED. V. THEOBALD, B.A., F.E.S.

JUST as Australia is peculiar for its remarkable marsupial fauna and gigantic fossil kangaroos, so is New Zealand for its peculiar Wingless Birds, living and extinct. Of these wingless forms there are not many known, but those that we are acquainted with are of great interest. Were it not for man's presence upon the earth, there is little doubt that we should have many more of these apterous birds, for history and tradition clearly show that several of them have been exterminated by man and by the introduction of his domestic animals. The Ratitæ, the group to which most of the living wingless birds belong, are found in Africa, where the representative is the ostrich, the largest of all the living aves, attaining sometimes the height of eight feet; in America, where the rheas are found extending into Patagonia and Peru; in Australia by the emu; in New Guinea and Moluccan Islands by the cassowary; and in New Zealand by the curious wingless apteryx or kiwi-kiwi of the Maoris. The African ostriches are the most important to us financially, for from these birds the much-sought-after ostrich feathers are obtained.

Strictly speaking, none of the living Ratitæ are wingless birds, for all possess a small and rudimentary pair of wings, although they are too small to be used as organs of flight. The ostriches run with extraordinary speed, and can give the fastest horse some trouble in pursuing them. The male ostrich is like a Mormon, fond of many wives!—These polygamous birds generally keep together in small flocks, and lay their eggs, sometimes three pounds in weight, in holes scratched in the sand. It is generally supposed that they are then left, and are hatched by the heat of the sun—a fallacious notion, for the parents look

after them, like all other birds; according to Mr Selater, the male alone does this, but authorities seem to disagree. The ostriches of America are quite distinct from those of Africa, and have a feathery head instead of a naked one. These rheas are also polygamous, and inhabit the great plains of South America, and are especially abundant along the La Plata.

Our next wingless form, the emu, comes from Australia. We shall find that all the living representatives of this remarkable group of birds in this part of the globe are clothed with feathers that are scarcely distinguishable from ordinary hair. The '*Dromæus novæ hollandæ*,' as naturalists designate the emu, is not unlike the ostrich in size, form, and habits; but there is one important difference that the hunter soon finds out, and that is, that the emu can kick with more deadly effect than the ostrich. The latter bird kicks forward, as we do; but the emu kicks backwards and sideways, like a cow. Little chance of escape has the unlucky hunter or hound that approaches near the back of this bird before it is tired out. The flesh of the emu is very good, and for this reason they are hunted and destroyed. So great has been the destruction, that fears are entertained that it may soon be numbered with the other extinct wingless forms that man has largely to account for.

From New Guinea, Moluccas, Malay Archipelago, and North Australia, another genus of struthious birds has been found—namely, the cassowary; not that notorious creature that 'ate the missionary on the plains of Timbuctoo,' for the true cassowary is only found in Oceania and the Malay Archipelago.

Although the wingless birds just mentioned attract much attention, there is nothing particularly striking in them, unless it be their remarkable grandeur; but when we come to the wingless forms of New Zealand, we cannot help being surprised at their extraordinary appearance. Australia is often called the 'Fossil Continent,' and rightly too, for its mammals, fish, and plants carry our minds back to long past ages; and we can say the same of New Zealand, if we look at the wingless apteryx. The kiwi—as the Maoris call this wingless creature—reminds us of no living bird, but calls to our recollection the birds which may have left those footprints on the sandy flats of Triassic times. These weird-looking kiwis vary in size from that of a fowl to that of a turkey. There is scarcely a trace of wings; the whole head and body is clothed with long hair-like gray and chestnut-brown feathers. The thick, tough skin is much valued by the Maori chiefs; and to their continual hunts after them is due the rapid disappearance of these remarkable birds. They have survived so long chiefly on account of their nocturnal habits. The natives hunt them by torchlight, when they come out at night to feed upon the insects and worms. Four species seem to be known; but all are rapidly becoming scarce, and, as Wallace rightly says, 'they will no doubt gradually become extinct.' Not so many years ago, the apteryx was thought by many scientific men to be a fabulous bird, just as the giraffe in olden

times was considered a myth. The first living specimen was brought over in 1852, and deposited in the Zoological Gardens, London, and, to every one's satisfaction, it laid several eggs. Perhaps the eggs of the apteryx are even more remarkable than the bird itself, for they often weigh as much as one-fourth of the weight of the whole bird. We find their fossil remains with those of the huge extinct 'Moa birds.'

Few birds have been more freely discussed than the moas, a group of struthious birds of enormous size, which inhabited New Zealand during and prior to the period of human occupation, and which, according to some authorities, only became extinct just before Captain Cook's discovery of the islands. Many of the moas were much larger than the ostrich. They agree in many features with the apteryx; while in their short beak and other important peculiarities they resembled the emu and the cassowary. These gigantic birds sometimes reached the height of eleven and twelve feet. Their remains are found in great abundance, and from them many complete skeletons have been formed in all stages of development, whilst their eggs are often preserved with their bones. That they were co-existent with man is shown by the fact that their remains are found in abundance in the kitchen-middens, whilst some of the bones are charred and cut. The first discovery of these giant birds was due to the Rev. W. Colenso, who also first determined their struthious affinities. In 1842 this gentleman wrote: 'During the summer of 1838 I accompanied the Rev. W. Williams on a visit to the tribes inhabiting the East Cape district. While at Waiapu, I heard, from the natives, of a certain monstrous animal. While some said it was a bird, and others a person, all agreed that it was a moa; that in general appearance it somewhat resembled an immense domestic cock, with the difference, however, that it had a face like a man's; that it lived on air, and was guarded by two immense Tuataras, who, Argus-like, kept incessant watch while the moa slept. Also, that if any one ventured to approach the dwelling of this wonderful creature, he would be invariably trampled on and killed by it.' A mountain named Whakapunaki was spoken of as the residence of this creature; but only one existed, which was said to be the sole survivor of the race of moas. For a long time it was hoped some solitary living specimen might be found in some high mountain region; but now all chance of finding this interesting and uncanny creature has vanished.

Mr J. Hamilton records an interview with an old native who asserted he had seen Captain Cook and also the last moa, and he described it as a very large bird with a neck like a horse. Whether any one has seen the bird is still very doubtful; but that it was coexistent with man—either ancient moa-hunting Maoris, or a moa-hunting race that inhabited New Zealand prior to the Maori invasion—is definitely shown by the bones and eggs being found with the evidences of man in those curious kitchen-middens and caves. Not only are the bones and eggs found, but in several instances the tendons and feathers attached to their skin have been discovered. The question is, How did these birds become extinct? There is no doubt that man has had the chief

hand in their eradication. To moa-hunting men their disappearance must be largely attributed; but certain evidence also shows that the glacial period has had no small finger in the pie in this matter. 'The recent existence of the moa, and its having been finally exterminated by the Maoris,' says Wallace, 'appears to be at length set at rest by the statement of Mr John White, a gentleman who has been initiated by their priests into all their mysteries, and who has been collecting materials for a history of the natives, and is said to know more of the history, customs, and habits of the Maoris than they do themselves. He says that the histories and songs abound in allusions to the moa, and that they were able to give full accounts of its habits, food, season of the year it was killed, &c.' Although the moas are called wingless birds, they, too, like the other Ratitæ, have rudiments of wings. It is probable that these struthious birds do not owe their imperfect wings to a direct evolution from some ancestral reptile form, but to a retrograde development from some low type of winged bird analogous to that which has produced the dodo of Mauritius from a more highly developed pigeon-form.

The dodo has become extinct, we know, during the last two hundred years. Mauritius, Rodriguez, and Bourbon (now Réunion) are remarkable as being the home of this curious group of ground-birds, quite incapable of flight. Leguat, who resided in Rodriguez in 1692, gives an admirable figure of the species on that island called the Solitaire. All these Dididæ were helpless creatures, and were soon destroyed by man and his animals. We have strong evidence that the origin of these large wingless 'ground-pigeons' must date back to early Tertiary times. Some ancestral 'ground-pigeon' like the *Didunculus* of Samoa must have reached Mauritius by means of intervening islands, afterwards sunk; and there, on this isolated spot, they remained and increased, free from the attack of any more powerful animal. We can easily see how their wings, being useless, would become abortive. They might even be prejudicial to the birds; for those that flew about would be blown out to sea and destroyed; whilst those that had small wings would roost upon the ground, and thus be sheltered from the violent hurricanes that continually sweep across these islands.

There are other extinct wingless birds, rails, also found; and in Rodriguez an almost wingless heron. Another large apterous bird, known as the *Apyornis*, has recently been brought before the notice of the public by the sale of its semi-fossil egg for the large sum of sixty pounds eighteen shillings. This *Apyornis* was a native of Madagascar, and is related to the moas and ostriches. It was as large, or larger than the moas of New Zealand. Its eggs were of enormous size, often reaching fourteen inches in diameter, and equal in capacity to six eggs of an ostrich.

There are several other wingless birds of different groups existing at the present day, and from them, as well as from other reasons, we can safely say that the wingless struthious birds, the emus, the ostriches, moas, and the dodo, are simply degenerate or retrograde forms, and not birds of low type with wings as yet undeveloped. There is good reason for believing that the

Ratitæ are a very ancient group, for we find the remains of the moa in New Zealand long prior to man's advent. Day by day, they and other wingless birds are becoming things of the past.

NEGRO COFFEE.

NEGRO or Wild Coffee is the name that has been given to Fedegozo seeds, on account of their being used in western tropical Africa and in some of the West India Islands by the natives as a substitute for coffee. In some of the French African colonies the seeds are also known as *Café nègre* and *Café marron*. Botanically, the plant producing the seed is known as '*Cassia occidentalis*.' It grows very freely in most tropical countries; in fact, it is a common weed, with a sickly, offensive smell, that many planters would fain be rid of. The seeds are roasted and ground, and the infusion, made in the same way as ordinary coffee amazingly resembles the finest Mocha. This fact is confirmed by Dr Nicholls of Dominica, who, writing to the Director of the Royal Botanic Gardens, Kew, a few years back, states: 'I collected some seeds, and directed my cook to roast and grind them, so that I might taste the "coffee." Other matters engaging my attention, I forgot the circumstance until several days afterwards, when, one evening, my wife inquired how I liked my after-dinner cup of coffee. I turned to her inquiringly, when she laughingly said: "That is your wild coffee." I was indeed surprised, for the coffee was indistinguishable from that made of the best Arabian beans, and we in Dominica are celebrated for our good coffee. Afterwards, some of the seeds, roasted and ground, were brought to me, and the aroma was equal to that of the coffee ordinarily used in the island.'

Dr Livingstone took some of these seeds to the Mauritius Botanical Gardens, and mentioned that the natives of tropical Africa roasted and used them like coffee.

It has not been definitely stated that the infusion has any stimulating effect, but it is only fair to suppose it has, otherwise the negroes would hardly employ it in lieu of coffee. Chemical analysis shows it to consist of fatty matters (olein and margarine), 4.9; tannic acid, 0.9; sugar, 2.1; gum, 28.8; starch, 2.0; cellulose, 34.0; water, 7.0; calcium sulphate, and phosphate, chrysophanic acid, 0.9; malic acid, sodium chloride, magnesium sulphate, iron, silica, together, 5.4; and achrosine, 13.58 parts in 100. Achrosine is soluble in water, and communicates to the latter a garnet colour. It contains carbon, hydrogen, oxygen, nitrogen, and sulphur; but its exact composition has not been determined. It is soluble also in alcohol and in acids and alkalies. The colour cannot be fixed upon tissues by any known mordant, and it is this circumstance that induced Professor Clouet, who made the analysis, to term it achrosine, or 'not colouring,' although being coloured itself.

If we might venture an hypothesis, we would suggest that further investigation into this colouring matter may prove that the colour is the important feature from an alimentary point of view. This has recently been proved to be the case with kola. For many years scientists were

puzzled as to the nature of the substance in the kola nut that produced the stimulating and nutritive effect. It was at first suggested that it was due to caffeine; but experiments proved that this was not the case. At length, after prolonged researches, Professor Heckel of Marseilles practically demonstrated that the 'muscle-bracing' and other beneficial properties of the kola nut were entirely due to the presence of a colouring body which he designated Kola Red ('rouge de kola'), and which a German scientist has since named Kolanin.

Besides using Fedegozo seeds as a substitute for coffee, the natives employ the whole plant as a remedial agent in various complaints and diseases. It is closely allied to ordinary senna—in fact, in Liberia, on the west coast of Africa, it is called small senna—so readers will not be surprised to learn that the whole plant is purgative. This is mainly attributable to the mucilaginous and extractive matters in conjunction with the small percentage of chrysophanic acid that analysis proves to be present in the plant. Torrefaction destroys the purgative principle in the seeds and causes them to taste like coffee.

One of the most useful properties of the plant is its febrifuge action. It is generally administered by boiling an ounce of the seed in ten ounces of water; and when this quantity is reduced to nine ounces, it is given to the patient during the cold period of a rigor; a profuse perspiration follows, and the rigors do not recur. The seeds have repeatedly been employed in France and in some West India Islands for this purpose; and instead of the decoction being used as just described, sixty grammes of the seed have been macerated in a litre of Malaga wine.

The value of the plant is recognised in all parts of the world. Mohammedan writers recommend its use in cases of coughs, especially whooping-coughs; an infusion of the root is considered by the American Indians to be an antidote against various poisons; and in Brazil the same preparation is used as a tonic and diuretic in dropsy and liver complaints. This latter property has gained for the plant the same unconventional title that country children apply to our own dandelion.

PROBATION.

It shall be mine, although I wait for it—
Wait while the sweet dawn broadens into day,
And lets my longing eyes see, far away,
That land, my promised land—wait while I sit,
Wearied beneath the noontide glare, and smit
Almost to utter blindness—wait, till gray,
Between my eyes and it, the dim mists stray,
And over all the earth eve's shadows fit.
O throbbing heart, when thou hast learned to beat
With patient pulses—these sad eyes to shine
In fearless faith, and when my eager feet
Have ceased to choose their path—when e'en Love's
wine

Were bitter unless God have made it sweet,
Ah then—in that same hour—it shall be mine!

THE ETHICS OF HOTEL LIFE.

By MRS LYNN LINTON.

THE experienced know almost at a glance who is and who is not accustomed to Hotel Life. There is the same feeble helplessness of demeanour—the same lost and strayed air—the same kind of ‘Good gracious, what am I to do now, and what is going to happen next?’ which mark out the unaccustomed from the experienced, and give the latter the map of the country so soon as these others enter in at the door. The habits among themselves, too, of the unaccustomed betray them quite as much as their demeanour on first entering. There are certain who hold an hotel as no more public in the sense of self-restraint than their own home in the heart of the country. Have they acquired the bad habit of snap and snarl, of contradiction and interruption?—small check it is to them that strange and curious ears are listening to the familiar interludes which sound so bitter and are so futile! There is no malice, no real heart of sinful temper in these verbal scratchings. They mean no more than the stage combat—‘one, two, three, four, and cross over’—and their intimates take them at their full valuation. But strangers do not. Hence these two highly respectable and well-living citizens are set down as leading a cat-and-dog life, which they do not care to control even in public.

At the opposite end of the scale stand the unrestrained lovers—people who caress each other in public, call each other pet names sure to be of ludicrous complexion to strangers, and act generally as if no such thing as the dignity of reserve existed, and as if the sanctities of privacy were not different from the publicities of the market-place. These are the people who give each other choice bits or superfluous bits from their own plates; drink out of each other's glass; dispute amicably about the last teaspoonful of wine; and from start to finish act with the utmost unconcern as to appearances and the public verdict, thinking no more of their fellow-men than if they were two love-birds on a perch.

In a manner affiliated to these two types are the stand-off and the familiar—the people who look at you with a curiously supercilious air, as if questioning your pedigree, your upbringing, your business, your religious faith and political creed, and not by any means sure that the answers, if given, would be satisfactory. And there are the familiar, who call you ‘dear’ on the second interview, and before the third is out have confided to you their whole history—who they are and what they were, what their fathers died of, and how they lost their children, and anything else it may interest them to tell, to which you must make a show of sympathetic attention. Fortunately, these intimacies are like flowers without roots. They die as quickly as they are born, and their place knows them no more.

The unaccustomed are generally frightfully hard on the servants. They seem to consider the service of an hotel as a steady-going, unrelaxing automatic kind of thing, wherein the servants can never be tired, never want rest, never need to be absent from their posts for their own food or relaxation. It is a kind of ‘one down, another come on,’ to their mind. They do not realise the personality, the individuality, of any of the servants, but imagine that if one is tired another is there ready to take the work with the same automatic precision—the same minute attention to individual fads which persons of this sort demand from hotel servants. For this kind carries all its fads with it, and feels aggrieved if the chambermaid who has thirty rooms and their inmates to attend to, forgets this or mistimes that, bewildered as she is by the multiplicity of things to remember for those, unaccustomed, who treat an hotel as their private house, and themselves as the chief and principal of the whole affair.

Among these inconvenient inmates are the early risers. It is all very well to say that their servants are up every morning by six, and that six is as late as any well-conditioned domestic should be abed. The reasoning holds good for

those who go to bed at ten, and whose wildest vigils never stretch beyond eleven—those, too, who have had the whole evening and great part of the afternoon to themselves, when they might rest in tranquillity and gather enough strength for the next day's modest campaign. But for hotel servants—on their feet from seven till twelve, with no period of repose, not so much as a solitary half-hour they can call their own, things are different; and the abnormally early riser, demanding hot water, breakfast, what not, at inappropriate times, is a nuisance, and cruel at that. People who come to an hotel should come prepared to abandon a few of their own personal and special habits, and to conform to those which have been found best for the majority. Nowhere is that modern craze of 'individualism' more out of place than in a crowded hotel, where the smooth, the just, the humane working of things demands some amount of consideration from the visitors, and with this consideration a corresponding amount of giving up.

All sorts of characters meet you at the table-d'hôte, making a moral kaleidoscope as interesting and as infinite as is the material. There are the people who eat enormously, suggesting their determination to get their money's worth at all events. Come what may, they have paid for it, and they will have it. And there are people who pick and reject and grumble and find fault, with the air of the fastidiously accustomed who find nothing so good as that to which they have been used, and are for ever regretting their own cook and their own harler. And there are others so naïvely content with the horrible messes which come up under French names!--so touchingly sure that this is real French cookery, which they have heard of so often; and, dear me! now they have come across it, how good it is, and how far superior to our plain roast and boiled! With them are often children, who are encouraged to eat of everything that comes to table, and to eat without stint. If they do empty that whole dish of sweets, what harm? They are out in the open air all day long, and at such times as these it is well to enlarge the boundaries. What these small people manage to stow away in cheek pouches and supplementary stomachic store-closets not existing among the ordinary sons of men, is one of the marvels of hotel life. There it is, however; and it knocks the bottom out of all one's theories of what constitutes a proper dietary for the young, and of how much moral discipline should come into their education in the line of self-restraint as to appetites, fleshly and sensual. And speaking of children, too, a word has to be said in deprecation of the lax discipline and imperfect accommodation which makes the general drawing-room their nursery and playroom. Let them play and romp and dance and shout to their hearts' content, but let them have their own assigned recreation-room, wherein they can expand according to desire. To make the lives of the elder portion of the community unendurable by reason of the 'wild huzzas and cruel noise' so delightful to youth—so distracting to age—is an unfair division. Let the one be happy in its own glad noisy restless way; but let the other have peace, and the quietude without which is infinite suffering.

The windows are the grand battle-ground of

differences in age and constitution. There shiver the poor old goodies whom bronchitis catches by the throat if but the keen wind looks too sharply through the closed windows. There flush the radiant young and the many-fleshed mature, who fan themselves at Christmas-time and cannot exist with closed windows winter or summer, night or day—who enjoy a draught, and call a keen north-easter jolly. And who, pray, is to decide between them? As a rule the young have it, and the poor old goodies suffer. Here, rheumatic pains are increased and the stiff walk becomes a decided hobble. There, the old familiar enemy swoops down on the helpless victim and chokes him with worse than desert-sand. Then a week's spell in bed, with doctor and drugs and so much loss of time and enjoyment, makes the practical comment on the wisdom of sitting in a draught with a keen wind racing through the window to the door. The same thing goes on in the drawing-room, which the children use as a passage-place into the garden, with the necessary result of cold shivers down sensitive backs, and catarrhs of various kinds and different locations. But the old and frail have the worst of it, inasmuch as pains and sickness are worse than 'stuffiness' and discomfort.

Of the company, what an infinite variety! There are the badly dressed—men who slouch down to dinner in knickerbockers and a Norfolk jacket, and women who wear crumpled collars and faded blouses. And there are the full-dressed, who make the mixed crowd of a second-rate hotel occasion for display in fine linen and diamond studs—bare shoulders, rich velvet, much jewellery, and an air of ballroom elegance. There are the free and the frightened—men whose hail-fellow-well-met kind of advances you have to resist; and timid girls, who could not answer you 'yes' or 'no' if you spoke to them, which in very pity you do not. There are the emphatic Nobodies who come from small provincial towns, and are flustered and excited at this their deeper draught of life; and there are the Somebodies, as yet anonymous, who come into the room with that air of distinction unmistakable and not to be gainsaid. They may be homely in feature, insignificant in person, by no means taking—but they are Somebodies. That stands out as plainly as the dome of St Peter's, and you seize the subtle announcement on their first entrance into the room. By-and-by you find how right your prognostic was, and are perhaps startled by the breadth and weight of this Somebody's repute. Sometimes these lions are humane and modest-mannered enough. Sometimes they are terribly the reverse, and can only be appeased by being induced to roar while fed with cakes of flattery and attention. And sometimes even they, great as they are, are served with the very cheese-parings of renown; when that benighted citizen says doubtfully, 'Don't know the name. What is he? What has he done?' Or some less imperfect if more entangled critic pronounces joyfully: 'Oh, he is Mr So-and-so, and he wrote that beautiful book of poems, don't you know?' But, unfortunately for the critic, he never wrote a line in his life, save, perhaps, the titles of his pictures for the R. A.; or haply his hypothetical book of poems was a successful play, or a novel that made its mark, or maybe only a book of philosophy, more widely talked

about than read, and less understood than discussed.

Many and many more types we must leave out of our gallery. The people who gather all the good things to themselves and their own party, and revel in abundance while others have nothing—what a well-known hotel type that is! So are the good-natured souls who are always willing to share their advantages, and who look after your little extra wants as if you were at their own homes. The people who—with a party of Irish priests at that table there in the corner, Home Rulers to a man as they are—sound the tocsin of the Union loud enough for all the room to hear. The rowdy sons and daughters of the Bank Holiday yesterday, who, at breakfast, sing, shout, let off little sharp screams mingled with gurgles of laughter, pull crackers, and generally comport themselves as 'Arrys and 'Arriets are wont to do. The people who slip by the servants, or scamp the tips when they cannot save them altogether, on the futile plea, 'Attendance charged for in the bill;' and the people who know that tips are expected, are part of the provisions of the place, and that no one who really respected himself would dream of 'bilking' the servants, as of old the scamps of the road used to 'bilk the pikeman.' The people who practise their scales, and play with humdrum fidelity for the stipulated two hours every day—or the piano is 'sick' and under a physician in the shape of a tuner with a plentiful supply of catgut in his pocket. These and more we encounter in an hotel, where also we meet the lovely and the genuine, the gentle, the refined, the unassuming, the enchanting. In any case, an hotel is a microcosm where we stumble against oddities of various kinds. And all this time we have left those ethics alone!—those ethics which can be compressed into a single sentence the briefest word of advice. 'Remember, an hotel is not home; nor are strangers your own familiars; nor, in a crowd, can you claim the special indulgences rightfully due to the one and the other.' The law of hotel life is consideration for others; and the purest form of socialism we have yet accomplished is to be found in a public drawing-room and at a table-d'hôte.

POMONA.*

CHAPTER XVII.

A tone which is now for ever fled;
A hope which is now for ever past;
A love so sweet it could not last,
Was time long past.

SHELLEY.

'HAS Mr Ludlow come home yet?'

'No, Missy; but I'm expecting him every minute.'

'But if he had come by the train he fixed, he would have been here an hour ago.'

The old man smiled. 'I think I can guess pretty well what he's doing. He's gone round by Burlington House just to have a look at his picture.—Bless your heart, he was so terrible took up with his Pomona, he could hardly bear to part with her. When the cab came to the door to take it to the Academy, I think he'd two

minds about letting it go, even on the chance of its not being hung. I've known amany painting gentlemen, and they're all a deal took up with their own pictures, though some of them hides it more than others; but I never saw one so downright wrop up as him; and he've stuck a fancy price on it, so as no one shan't buy it.—But come in, Missy, and I'll fetch up the tea. He'll be here in a—— Bless my heart!' Warren ended in a bewildered whisper, 'whoever is that young lady? I seem to know her face pretty near as well as I do yours.'

'It is my cousin, Miss Lester,' Sage said; 'but I don't think you can have seen her before.'

The whisper had not been lost on Pomona, and both she and Sage enjoyed the mystification of the old man; and the puzzled looks he stole at her as he spread the little tea-table in the studio, making excuses to come again and again to re-arrange the tea-things or bring an extra plate or teaspoon; and once Sage caught him standing staring with a plate of biscuits in his hand, from which, in his abstraction, an avalanche was descending on to the floor.

Pomona was examining with interest all the pretty artistic things with which the studio—unlike that of Owen Ludlow's at Scar—was adorned. A studio was quite as great a novelty to her as a shabby, little house in Dalston; and both one and the other struck her as intensely interesting, and something fresh and outside the conventional limits within which the lines of her life had hitherto been cast.

To Sage it was all familiar; but perhaps no less interesting than it was to Pomona, as association took the place of novelty with even more powerful charm; and where Pomona saw richly coloured Oriental tapestry, Sage saw the background to a picturesque figure; and where Pomona exclaimed over a Venetian mirror with quaint embossed silver frame, Sage could echo the admiration, seeing in it the dark handsome face and smiling eyes it had so often reflected. That bronze Mercury was beautiful and graceful, as Pomona said; but the beauty and grace were entirely associated with Maurice, saying before he went away in the winter: 'I wish I had winged heels like this chappie to bring me to my lady-love.'

There were not many pictures about; but Pomona was looking at some canvases standing with their faces to the wall in a corner, when the sputtering, spitting, little silver kettle on the tea-table called Sage away to make the tea; and while she was doing it, Pomona gave an exclamation of recognition.

'Sage, I am sure I have seen this man.—Oh yes; of course it is a Mr Moore I met at Mrs Coppleston's dinner. He told me he knew Mr Ludlow; indeed, it was he who first told me anything about him. It is only a sketch, but it is very good.'

Sage spilt some of the hot water on her finger, suddenly startled by hearing Maurice's name.

'Look,' Pomona went on—'do you know him?'

'Yes, a little.' It was no doubt the scalded finger that sent the rush of colour over Sage's delicate face and neck; and Pomona was eager in her sympathy and wish to do something to alleviate the pain, though Sage declared it was

nothing at all to trouble about, and would be all right in a minute.

Just then they heard a cab stop and the sounds of an arrival, a portmanteau slammed down in the hall, and Ludlow's voice talking to the cabman, and Warren's voice informing him that Miss Sage was there and another young lady; and then Ludlow's step sounded along the passage. He came in through the other room that opened into the studio, where he and Dr Merridew had sat on Christmas Eve, and Sage went forward to meet him.

'Well, little friend,' he said in his usual hearty, cheery voice—'well, this is a pleasant welcome. Where's'— And then, behind Sage, he saw Pomona, and the words died on his lips.

She was standing full in the light, looking towards him with a grave, shy look, that—Sage thought with a slight sense of disappointment—was less like the picture than the radiant, bright look that was more usual to her. Sage did not know how wonderfully more like it made Pomona to Katharine, the young wife whose sweet eyes had closed on this life twenty years ago.

Owen Ludlow still held Sage's hand in his in affectionate greeting, and Sage felt his hand grip hers with a sudden, painful pressure, and saw that his face had turned an ashy sort of white. It had not occurred to her till then that the likeness to the picture meant also the likeness to the dead wife, who was so living a memory in his heart; and she wished now that she had prepared him for it.

'This is Miss Lester,' she said quickly—'my cousin, Pomona Lester.'

He had recovered himself in a moment, and came forward with something of his usual courteous manner. 'I am very pleased to make Miss Lester's acquaintance. I am sorry to have been delayed in returning; and I hope Jervis has done the honours and brought you some tea.'

Sage fancied there was an unnaturally stiff tone in his voice, and a cold look in his eyes, almost of aversion, as he looked at Pomona, who, on her side, had a little touch of haughtiness in her manner, and an elegant, chill formality that had been conspicuous by its absence before, every look and movement and tone having seemed so wonderfully simple and natural and unconscious.

Sage was uncomfortably aware that this introduction was not a success—that these two friends of hers were not getting on and did not take to one another. She could see, with Pomona's eyes, that Mr Ludlow without his sympathetic, kindly manner was not attractive; while, with his, she could see Pomona as a 'fashionable young lady, giving herself haughty, fine-lady airs. She could not tell the other feelings that were surging within him, and had to be kept rigidly down by that stiff, rather over-polite manner, which Sage dreadfully feared Pomona might consider bad form.

She did not know that when Ludlow's hand touched Pomona's, he felt a tiny baby's purposeless clasp that had folded round one of his fingers twenty years ago, as he stooped to kiss a warm, little forehead among the folds of a big, white shawl. She did not know Pomona's eyes were really Katharine's looking across those twenty years at him with silent reproach. She did not

know how, after the first shock, followed by a desperate effort to disbelieve in the girl's identity, and assure himself that the likeness was purely accidental, that very likeness had been hateful and repugnant to him; the tone of her voice, an echo of the melody of that sweet honey-moon year, jarred and stung him; the curve of her cheek and line of her brow irritated and filled him with a sort of resentment; the very position in which her slim hands lay in her lap fretted him almost beyond endurance.

Pomona, on her side, felt repelled and disappointed. Maurice Moore had spoken so warmly of the painter; Sage had sung his praises so heartily; she had been so interested in his studio, and naturally she was much more inclined to like than to dislike people. In all her sunny, happy life, she had hardly ever met with any one to dislike, having one of those natures that see the best in every one, and so her whole world was inhabited by nice, pleasant, interesting people. It is a blessed gift to be born with, this quality of seeing the best. I hardly think a fairy god-mother could give a better, happier gift to a child in any rank of life. Oh yes; no doubt they will be constantly taken in, constantly disappointed; but that is infinitely better than to live in a dreary world, seeing only the low motives, bad disposition, meanness, and selfishness that are no doubt only too conspicuous in most of us, though, thank Heaven, not unmixed in any of us.

But Pomona's feeling for Mr Ludlow amounted almost to dislike, and being such a very unusual sensation with her, it fretted her, and made her uncomfortable, and she was glad to take her leave as soon as politeness allowed.

Nothing was said of her likeness to the picture. Owen Ludlow talked hard and heavily on society subjects in which he was not at all *au fait*, and Pomona answered with hardly veiled indifference. Sage vainly tried to make things run more easily and pleasantly, and it was a relief to all when Pomona declared she must go.

She wanted to take Sage back; but Mr Ludlow would not hear of it, declaring that was his privilege; and while he went to see if the carriage was there, Sage said: 'You don't know how nice he can be.'

'I am sure he can be very nice to you, dear; but I don't think he would to me. He doesn't like me.'

'Oh, Pomona!'

'I don't mind a bit, dear, little Sage, as long as you like me, and I am sure you do.—When will you come and see me? And what day shall we go down to Beechfield together and see mother? Come to-morrow morning and have lunch with me?—No! too busy? Well, I will write. I am so, so glad we have met.'

And then the painter returned and ceremoniously escorted Miss Lester to her carriage.

'Are you ill?' Sage asked anxiously as the painter came back into the studio.

He was walking very slowly, and his head was bent, and his shoulders stooped like an old man, and his face had a drawn look on it as of suffering.

'No, little friend, not ill, only old and tired, and not up, as you may perceive, to fashionable society. I didn't know you had such fine rela-

tions, Sage—and yet, I think your father told me once of a cousin.'

'I never saw her till to-day.—Oh, Mr Ludlow, don't you think she is lovely?'

He paused a minute, and then said with cold impartiality: 'Yes, perhaps she would be considered so.'

'But don't you think so?'

'Well, I am not sure.'

He was moody and absent; and Sage hardly knew if he were listening to her description of Pomona's sudden appearance that afternoon, and how sweet and cordial she was, and how she wanted her, Sage, to go down with her to Beechfield to see 'my aunt, Lady Lester.'

I do not think one need call it snobbishness the pleasure those last words gave to Sage; or if it were so, it was snobbishness of a very simple elementary sort, not unnatural in a girl who, till that afternoon, had thought of titles as belonging to people in books and newspapers, not to any one in ordinary life, certainly not life in Dalston.

She was longing to tell it all to Maurice; it was such a gratification to think that her relations would bear comparison with his; it had always rather afflicted her that Maurice's friends and relations should be in a higher station than hers; and if she had not loved him so, the feeling of condescension on his part would soon have become galling. I think it was this that made her shrink a little from descriptions of any society he went into, which shrinking had led to her hearing hardly anything of the dinner party at the Coplestons at which Maurice had met Pomona. But now that it would be give and take, she would like to hear all about his friends, and would not even mind being introduced to them; and, by-and-by, she would tell Pomona of their engagement, and take Maurice to see her, and, perhaps, to the beautiful place at Beechfield, and to 'my aunt, Lady Lester.'

I have said that in old days at Scar these two friends had no scruple in relapsing into silence when thoughts grave or gay absorbed them; and so now Sage's thoughts were roaming away; while perhaps Owen Ludlow's were as far from the studio and the present, only his were wandering into the past, sad and gray, while hers were venturing into the rose-coloured future.

'I think,' he said at last, drawing his hand wearily over his forehead and eyes—'I think I shall go back to Scar to-morrow.'

CARVED IVORIES.

THE subject of Carved Ivory forms one of the most important branches of the industrial arts, for from extant examples the art may be traced from prehistoric to the present times, and specimens of carvings made by all peoples in all ages may be seen in the public museums and collections. Owing, probably, to the little intrinsic value of ivory, many specimens have been preserved, it being a substance of little or no value for turning into bullion, so much needed for the successful carrying on of the wars of the middle ages; many specimens also were preserved and hidden, owing to their portability and small size.

At the present time, when so many vegetable substances are being used in the place of ivory, it is as well that the nature and characteristics of true ivory should be stated. If a section were to be taken and carefully examined, there would be observed series of lines proceeding from a common centre in arcs of circles, also that these arcs intersected one another and formed minute diamond-shaped spaces. In its strictest sense, true ivory is confined to that kind of tooth-substance which shows such diamond or lozenge shaped spaces.

The chief source of ivory is that obtained from the elephants of Africa and Asia. Ivory so obtained may be distinguished, owing to the African when first cut exhibiting hardly any grain, being first of a transparent tint, afterwards becoming lighter in colour. Asiatic when first cut is like African which has been cut for some time, but becomes yellow by exposure to light. The African has a closer texture, and is capable of being more highly polished than the Asiatic variety. Beside elephant ivory, other substances have been largely used in the carving of the middle ages, notably walrus, narwhal, and hippopotamus ivory. It is interesting to note that King Olthere of Norway visited King Alfred the Great in 890 A.D., after a walrus hunt in the North Sea, one of the objects of which was the obtaining of walrus ivory. Another very important source of ivory is that obtained from the Mammoth, the extinct *Elephas primigenius*. Large quantities of this ivory have been found in the frozen soils of Siberia, it being said that nearly all the turned ivory-work of Russia has been made from this so-called fossil ivory. These extinct elephants from which it is obtained have been immured in the frozen soil for countless centuries. In prehistoric times herds of these animals roamed over Western Europe.

The very earliest carvings now extant are those found in the caves of Le Moustier and La Madeleine, preserved at Paris, bearing representations of animals as seen by the prehistoric men. Amongst others are an ibex, a reindeer coming to a stream to drink, and perhaps the most important is an incised carving of the Mammoth, showing the long curved tusks and the shaggy mane, such as none of the present species possess.

Many centuries elapse between the prehistoric ivories and those to which any approximate date can be assigned. As in regard to other of the industrial arts, so in regard to that of carved ivory the earliest mention is referred to Egypt; a tablet of the twelfth or Theban dynasty (c. 2020 B.C.) gives directions for the making of a small statuette, parts of which were to be of ebony and parts of ivory.

In the British Museum are various chairs and other articles decorated with ivory, to which have been assigned dates varying from the eighteenth to the tenth centuries B.C., notably two daggers

with plain uncarved ivory handles dating from the eighteenth or seventeenth century B.C.

One of the most interesting series of all the objects found at Nineveh was a very valuable collection of about three hundred carved ivories, probably made between the ninth and eighth centuries B.C. They were discovered by Sir Henry Layard in a room, possibly the Treasury of the North-west Palace; and when found, were in a very brittle condition, owing to the fatty substances of which ivory is partly formed having decomposed. When brought to England, they were boiled in gelatine. As a consequence, they again became to a certain extent solid, and were placed (and are now to be seen) in the British Museum. Amongst the largest specimens, certain plaques with representations of Egyptian monarchs are finely carved. A very large number of small pieces consisted probably of the frieze placed round some valuable chest or coffer. Amongst other portions to be seen are some few which have small cells cut out of the ivory, and into which have been let portions of lapis lazuli and gold, the largest of this kind of work being a piece which is stated to have formed a part of a throne. In the Old Testament it is said that Solomon made a throne of ivory and overlaid it with the best gold. Since these Nineveh ivories were probably made about the time of Solomon, and very likely in or near the same place where the throne of Solomon was carved, might there not now be seen in this piece in the British Museum a part of a throne similar to the one made for the Temple at Jerusalem?

Ivory is referred to in the Bible. The ivory house which Ahab made is stated to have been one of his memorable acts. In the prophets, mention is made of 'benches of ivory brought out of the Isles of Chittim,' 'horns of ivory' and beds of ivory. On a black marble obelisk brought from Assyria, and now in the British Museum, slaves are represented as carrying elephants' tusks; as also similar representations are to be seen upon the bas-reliefs of the ruined palace of Darius and Xerxes at Persepolis.

In the sixth century B.C. the towns of Sicyon and Argos were noted for their ivory statues; and in the year 600, the Cypselidæ sent as an offering to Olympia a chest of ivory and gold. About 490 B.C. the very large chryselephantine statues made by Phidias and his contemporaries are noted. These statues, which were made partly of ivory and partly of gold, were of all sizes, ranging up to fifty-eight feet in height. It is very difficult to know how the ancients could have obtained such large pieces of ivory necessary for the making of these statues; and many theories in regard to it have been formed. Some think that the ivory was welded together in a way unknown now; others, that large plaques were hung on or fastened to an inner core, and the joinings carefully concealed, somewhat similar to the way by which the Battersea enamellers in later times concealed fire-flaws and cracks on their finest pieces of work by painting sprays of flowers over these cracks.

It would seem probable that the flesh-parts which were exposed to view were of ivory, whilst the dress was of gold. Of all these statues, the two most important were the figure of Minerva, which was placed in the Parthenon, and was

forty feet high; and that of Jupiter, placed in the temple of Zeus, at Olympia, and fifty-eight feet high. These statues, which were seen and described by the old writers of the early centuries before and after Christ, were destroyed by the fanaticism of the early Christians.

Very few ivories carved before the time of the Emperor Constantine (324 to 337 A.D.) are in existence. Most of the larger European museums possess one or two specimens; the South Kensington Museum has two such—one, a portion of a sacrificial cup; the other, one leaf of a diptych bearing the name of 'Symmachorum' incised upon it.

The subject of diptychs and triptychs is a very interesting one in connection with ivory. Anything doubled or doubly folded may be called a diptych; and should it consist of three parts, the two outer leaves of which fold over and enclose the central one, the object would be a triptych. During the early centuries before and after Christ, it was customary to use diptychs and tablets for writing purposes; the outside would be made of wood, bone, or ivory; the inner surface being hollowed out and coated with wax, which latter was scratched upon with a stylus. Two small diptychs with characters scratched upon the wax were found a few years ago in a gold mine in Transylvania, and from the words upon them it is known that they were made in 169 A.D.

When a person was elected consul under the Roman Empire, it became customary for him to send presents to the senators, high state officials, and other friends. These presents were very costly; and amongst others sent were ivory diptychs, upon the outsides of which would be generally carved a representation of the consul himself seated in his curule chair and attired in his official robes. In a lower compartment would be carved representations of the games with which the consul would inaugurate his year of office. Inside, the wax was inscribed with the names of the preceding consuls, finishing with that of the donor. At the present time, twenty-one distinct examples of these consular diptychs, as they are called, are in existence, some of which may be seen in the British and South Kensington Museums, and at Liverpool, Milan, Darmstadt, Berlin, Paris, &c., and date from the third to the sixth centuries A.D., and are chiefly of Byzantine workmanship.

A second class of ivory diptychs are those known as 'Non-consular,' generally having been made for some special purpose, and often of very great beauty. Among others may be mentioned that of Æsculapius and Hygieia, now at Liverpool; and the Tablet of Sens at Paris. But perhaps one of the finest ever sculptured is a single leaf of a diptych previously mentioned, inscribed 'Symmachorum,' the other leaf, much damaged, being in the Cluny Museum, Paris. The two leaves originally formed the doors of a reliquary at Moustier, in France, probably being used for that purpose some time in the eighth century. As a diptych, they may have contained the marriage contract between members of the Nicomachus and Symmachus family, the names inscribed upon each leaf.

In the British Museum, one of the largest carved ivories in existence is a diptych leaf of

Byzantine origin, sixteen and a half inches long and five and a half inches wide.

In the seventh and eighth centuries, possessors of diptychs presented them to the Church, and then, instead of containing the names of the consuls, they enclosed the names of persons who should be prayed for, the lists being read out at mass. A few such diptychs still exist, and are classified and known as 'Ecclesiastical.'

A very important work in ivory in the sixth century A.D. was a chair made for the Archbishop of Ravenna (546-556), and now preserved among the treasures of the cathedral at Ravenna. At the end of the sixth century and early in the seventh century, there was a decline in art in Italy, but at the same time there was a revival in Eastern Europe; and plaques of ivory carved at this and later periods in and about that region are to be seen in museums, and are classified as 'Byzantine.' About the year 750, a bitter struggle commenced in reference to the use of images not only as used in churches but in private life, and under Leo the Isaurian the fanatics obtained great power. To the rage of these iconoclasts, the wholesale destruction of antique monuments and sculpture must be assigned.

Charlemagne, who at this period (812 A.D.) was the great potentate in Western Europe, sent a Commissioner to Greece to inquire into the persecutions, and at the same time to invite any persons who so wished to come and live under his sway. Many journeyed to Western Europe, and at the same time brought with them objects of art, by means of which examples the workers of the West were enabled to improve their arts, and among others, their ivory carvings. Works made during the period ranging to 972 A.D. are classified together and are known as 'Carlovingian.'

From about the year 870 to 972 A.D., Europe was much disturbed by wars, which, together with the prevailing idea that the end of the world was to take place in 1000 A.D., caused a great decline in all the arts.

In 972 the Emperor Otto II. of Germany was married to the Greek Princess Thèophanie, who when she came to Germany brought with her workers skilled in the arts of Greece. These workers were settled in the towns bordering on the Rhine; and objects made by these people, their pupils, and descendants, which show a style somewhat Byzantine in form, but at the same time with Western faces and other parts differing from those made solely in Greece, are classified together and are known as 'Rhenish Byzantine.' Although there was again a decline in art generally in Western Europe in the twelfth and thirteenth centuries, yet the arts were to a great extent fostered and protected in the fortified towns of the Rhine district; and of all the art objects made in the twelfth century, few can compare with two reliquaries made at Siegburg, each in the form of a Greek church, around which are placed statuettes of the prophets, Christ and the disciples; and at the ends of the transepts, carved plaques. The larger of the two is the property of the nation, and is to be seen in the South Kensington Museum, and has an interesting history connected with it. For many centuries it was preserved in the Abbey of Hoch Elten, near Emmerich, until the French Revolu-

tion of last century, when the Abbey was sacked. Rather than allow such a precious object to be stolen, the Abbess took it away and hid it in the chimney of a neighbouring house. A few years later it came into the possession of a priest at Dornich, who sold it for eleven pounds; the buyer again sold it to Prince Salm for thirty pounds, who in his turn sold it to a dealer for one thousand pounds; the latter disposing of it to Prince Soltykoff, at the sale of whose collection it was purchased for the nation for £2142; and if the price lately paid for an enamelled hunting horn, namely, £6615, may be taken as a guide, it would probably fetch almost a like sum.

As in regard to all the arts, so in regard to ivory, a great renaissance took place in Western Europe in the fourteenth century. Gothic architecture was well known, and was made to serve as a model for carved ivory diptychs. Many such are to be seen divided into compartments representing Gothic arches with trefoils and quatrefoils, under which arches religious subjects were carved. Many other objects now became carved in ivory, such as chessmen, combs, draughts, caskets, mirror cases, pastoral staves, 'taus'—the earlier form of pastoral staves—oliphants or tenure horns, and statues chiefly of the religious kind. In the seventeenth century, some very fine vases were made of turned ivory by Fil. Senger, turner to Cosimo III., Grand-duke of Tuscany.

In the sixteenth and seventeenth centuries, various sculptors in ivory were engaged in carving portions of tusks with classical and other subjects, which were afterwards mounted in silver or silver-gilt by some of the finest Augsburg and Nuremberg workers, and formed vases and tankards. In the eighteenth century, various carvings in ivory were made chiefly of statuettes and small plaques, but none attain to the excellence of the earlier carvings. In modern times, the ivory carvings of India have become noted for their minute and delicate work. In China and Japan, ivory has been carved, the ivory balls enclosed inside one another being specially noted. Many theories have been formed as to how these balls have been cut; perhaps a probable one is that a ball of ivory was taken, around the upper and lower ends of which four small holes were carved out, gradually diminishing in size towards the centre until the axis of the one hole met the axis of the other or lower one at right angles in the centre of the ball; and that then small tools were inserted, and a thin layer of ivory, forming a part of a circle from one hole to its lower corresponding one, was cut and loosened from the whole mass; and so gradually cutting from one hole to the next one, a complete inner circle was eventually loosened, the circles themselves afterwards being cut into the required pattern.

Attempts have been made to forge old ivories and pass them off as genuine old ones. In 1862 a copy of a leaf of a consular diptych was made from an old engraving which Wiltheim had made of it in 1659, and had been offered to and accepted by a continental museum as an original object. An English expert who was shown the forgery at once stated that the original was in the South Kensington Museum, and advised the authorities to take it out of its frame and examine

its back and to look for the writing which had been placed there in the eighth century. Needless to say, no writing was visible, and the forgery was at once detected.

A MESSAGE FROM THE DESERT.

CHAPTER III.

THE return of the eldest son and heir to the station created the usual amount of gossip in the district. Alf kept up the character he had first assumed of careless liberality, and did not interfere with Robert's management. He soon renewed his intimacy with the Rudders, and, as was but natural, became a devoted admirer of Kate's. On her part, it was only to be supposed that she should feel interested in him. He had plenty to talk about that had a certain charm of novelty; his adventures during the Zulu War and in the outside districts of Australia were told without boasting, and soon served to put him on a small heroic pedestal in the community.

As may be presumed, this intimacy with the Rudders was not at all to Robert's liking; and both men felt that it was, after all, but a hollow truce between them, and one that might be ruptured at any moment. Kate Rudder had no thought of arousing the younger brother's jealousy by treating the elder so intimately. She sincerely liked Robert, and it only wanted a word from him to awaken a warmer feeling.

Unfortunately, it was different with Alf. He had fallen head over ears in love with Kate, and felt certain that it was returned. It was evident that such a state of things could not go long without an explosion of some sort. Blanche had long guessed Robert's secret, and was prepared to become an active ally, should the turn of affairs necessitate it.

The smothered feud broke out one night when the two men were smoking a pipe before retiring.

'I intend to try my luck to-morrow,' said Alf. 'It's time I settled down and got married.'

'I quite agree with you,' returned Robert, somewhat meaningly. 'Where are you going to condescend to throw the handkerchief?'

'Oh, don't put on side. You know very well that I am going to ask Kate Rudder, and have every reason to suppose she will say yes.'

'It's a lie!' replied Bob furiously, a sudden gust of passion completely overcoming him.

Alf started, but checked himself. 'I can afford to laugh at you,' he said. 'Rave away; it won't whistle your sweetheart back.'

'If you put your boast to the test to-morrow,' said Robert, in a calmer tone, 'you will find yourself mistaken. I should advise you to stay at home.'

'Keep your advice to yourself, and don't provoke me,' said the other, who was now in his turn losing his temper.

'Provoke you, indeed!' repeated Robert contemptuously.

'Yes, you beggar, or I'll soon get rid of you.'

'As you did Sam?'

Alf leaped to his feet, speechless with a mix-

ture of rage and fear. Next minute, the two men would have been at each other's throats, but the door opened, and Blanche entered. 'I heard your voices raised,' she said, affecting not to notice their menacing attitudes: 'what are you quarrelling about?'

'Oh, we never could agree of old,' said Robert, trying to calm himself, as his sister approached him.

'Look here, my fine fellow,' said Alf; 'to-morrow you take yourself, bag and baggage, out of this; and just see that your accounts are square when I come to overhaul them.'

Robert's face turned fiery red; but Blanche caught his hand. 'If Bob goes, I go too,' she said.

'You are quite welcome,' returned Alf, who had completely dropped the mask.

'I will give you full satisfaction about the station accounts to-morrow morning,' said Robert; 'and in a short time I trust you will be able to give an equally satisfactory account of what I shall require from you?'

'What do you mean?' demanded the other fiercely.

'Simply, I do not believe your version of your trip out west. I will see what Burgess has to say in the matter.'

'You will have to go to another place than Queensland, then, for he is dead.'

'Oh, you knew that, did you? And yet you pretended to ask after him.'

'Pshaw! I will not stop to listen to any more nonsense. To-morrow, I will show you who is master here.' He left the room.

The brother and sister had a long conversation, during which, for the first time, Robert told her about the buried papers and what he suspected of their import. Blanche was naturally horrified, and reiterated her now fixed determination to leave on the following day. Robert impressed upon her the necessity of absolute secrecy; and they were about parting, when she asked him where he was going to when he left. For herself, she was going on a visit to an aunt for a while.

'I am going to the Northern Territory of South Australia to look for Jim Turner,' he said.

As he spoke, he had his hand on the door, and half opened it. A noise outside struck his ear, and he threw it wide open, and looked along the passage. A dark shadow vanished at the end as he did so, and it immediately occurred to him that Alf had been listening.

'Forewarned is forearmed,' he thought as he retired. 'I must guard against Master Alf getting any inkling of those papers, or he will be beforehand with me.' Then he thought that if Alf had been listening, he would have heard all he confided to Blanche; but on second consideration, he remembered that they had spoken low, all but the last words referring to Jim Turner, and it would be hard to trace anything from that.

Blanche had given her brother a hint that he had better test his fate with Kate Rudder as soon as practicable, and he determined to do it the first thing in the morning, if possible before he settled up with his brother. With this object in view he was up at daylight, and by sunrise was

on his way, calculating that he would arrive at the Rudders' station in time for breakfast. He managed to hit the meal very nicely; and while seated thereat, he informed his friends of his resignation, or rather deposition, in favour of his eldest brother. As the terms on which the two men stood were pretty well known, this intimation did not surprise anybody. It elicited, however, a quick glance of sympathy from Kate, which was sufficient satisfaction for Robert. He soon made an opportunity to ask the momentous question. As two ships converge towards each other in mid-ocean on a calm day, so the wooing and the wooed have a silent occult speech of their own which is better than any outspoken language, and serves just as well to convey the intended meaning. In the old nursery and schoolroom, now turned into a lonely kind of lumber-room, seldom visited, Kate and Robert plighted their troth; and then he departed with a light heart to seek the consent of her parent. Old Rudder half expected what was coming; and Robert was delighted to find that the return of the rightful heir did not affect his suit. The fact was that Rudder had seen enough of him and his management during the past ten years to feel assured that young Patten was one of the men bound to rise, and that the present would be merely a temporary eclipse.

The fifteen miles home—home no longer—were soon covered, and he entered the house to find his half-brother waiting for him. To his surprise, Alf approached him in the sunniest manner possible. 'Look here, old man,' he said; 'we shall always be snarling at each other, I suppose, as long as we are together; but let us have a try to do better in future at any rate. I will take back anything I said last night, if you will do the same.'

'I have made up my mind to go away and strike out for myself,' returned Robert, after a pause. 'As you admit, we should always be quarrelling; so it is best to part. I am glad it is not in anger, and am willing to forget the hasty words exchanged last night.'

'I suppose that is as much as I can expect from you,' replied the other. 'Go or stay, I shall not quarrel with you.'

After a hasty packing-up, Robert and his sister started in a buggy to the neighbouring township of W—, whence they would take the train to Sydney, where Robert intended to leave Blanche with their aunt.

Meanwhile, Alf went headlong to his fate. He had determined to propose to Kate Rudder, and rode over that day for the purpose. What he then learned did not improve his temper. He rode home in a mood of sullen spite, revolving in his mind the best way to obtain his own will and thwart his rival.

Robert wrote a short but explicit letter to Owen, the manager of Bendabar, on whom he thought he could rely, asking him to observe the strictest reticence concerning the buried papers and their whereabouts, and if any one turned up inquiring for them, to put the seeker, if possible, on a false scent. He further took him into his confidence concerning the return of the elder brother, supposed to be dead; and also told him of his purposed quest for Turner, who seemed to be the only man who could point out

the hiding-place. He then made a hasty trip to W— to say good-bye to his sweetheart, and started ostensibly to look for a suitable pastoral investment; in reality, he took the first steamer for Port Darwin.

A long narrow clearing through a dense scrub of upright 'mulga.' In the centre of this cleared track runs a row of telegraph poles, supporting a single wire, the slender link that traverses the Australian Continent from north to south, and binds it with an almost living bond to the rest of the world. At the edge of this thicket of mulga is a patch of open country, thinly timbered with coolibah trees. Here, alongside the rude dray-track that winds side by side with the line, are a couple of iron tanks, each containing about four hundred gallons of water, tanks such as are used on board of sailing-ships. A line-repairing party are camped on this open spot; and the tanks are kept full for the use of the men employed in the maintenance of the line. There are three men in the camp—an operator and two line-men; it is the middle of the day, and they are taking it easy in the shade; their riding and pack horses, hobbled out, are feeding a short distance away.

'Here comes the man they were telling us about when we spoke* Daly Waters Station,' suddenly remarked the operator, gazing up the long northern vista of the line.

'The man who is in search of Jim?' said one of the men, glancing at the third, who looked rather conscious.

Jim, who was the long-sought-for Jim Turner, busied himself in putting the fire together and placing a quart pot of water on to boil, for hospitality is the sacred creed of the bush; and the party were silent until the stranger rode up to the camp and dismounted.

'I suppose you are the repairing party from Daly Waters?' said the new-comer, after the customary greetings.

'Yes,' returned the operator; 'and I presume you are the man they wired to me about, looking for Jim Turner. This is Turner;' and he indicated the man in question.

The two nodded; and Patten—for it was Robert—remarked: 'I have had a long hunt for you. I suppose you are wondering what it is all about?'

'Better turn your horses out and have something to eat,' interrupted the operator; 'plenty of time for business afterwards.'

Patten accepted the invitation; and after eating his meal and finishing the regulation pipe, drew Turner on one side and broached the object of his visit.

'You were stockman on Bendabar,' he said, 'and were with Mr Hopwood when you picked up Burgess.'—Turner assented.—'The fact is simply this. You left Burgess to rest down there, while you went up to the station, got fresh horses, and came down again. While you were away, he buried certain papers he had, enclosing

* The operators on the overland line who are in charge of repairing parties carry small pocket instruments, which they can attach to the main wire by light wires, and thus converse with the stations north and south.

them in an old salmon tin that he picked up there. He is dead now; but before he died, he wrote and told me of these papers, giving me directions to find them by means of the marked trees about. I went to the place; but it is now all changed. The trees have been cut down; and a heavy flood has altered the appearance and size of the water-holes in the river. No one on the station knew the exact place; and as the clue he had given me was useless, my only chance was to find Hopwood or yourself; so I advertised in the leading papers.' Patten paused.

'I never knew of the advertisement until the other day,' said Turner; 'and then one of the chaps spotted it in an old number of the "Australasian."—Did you hear from Mr Hopwood?'

'Yes; and he wrote and said that, under the changed circumstances, he did not believe that he could point out the exact spot.'

'Then I'm blown if I could,' said Turner.

This was hard on Patten, and he hesitated for a moment. 'Look here, Turner,' he resumed; 'there's no occasion to speak hastily. Think the matter over, and see if you cannot remember any slight thing that will bring it back to you.'

Turner pondered for a short time. 'I might find the place if I was back there,' he hazarded doubtfully at last.

'It's most important that I get these papers,' went on Robert. 'I have been tracking you up now for six months, and I am not going to be balked for a trifle. I believe if you were on the spot it would all come back to you. I will tell you what I will do. I suppose your billet here is nothing very much; you could do as well in Queensland?'

'Just as well,' was the answer.

'Then I will pay your expenses round to the place, and allow you a couple of pounds a week during the time we are travelling. If we are successful in getting the papers, or what is left of them, I will give you a hundred pounds.'

'I'm in it,' cried Jim, without any hesitation; and they turned back to the camp.

Patten was sound asleep that night, when he was suddenly aroused by somebody shaking him by the shoulder. Rousing himself, he found it was Turner.

'It has all come back to me,' he said in an excited sort of whisper. 'I lay there thinking about picking up that man, and trying to puzzle out how I could make sure of the place, when all of a sudden I remembered about filling the quart pots. Right straight under our camp a bar of rock crossed the bed of the river. I remember it well because the water was deep just alongside, and it was so handy to stand on and dip the quarts. Of course, Mr Hopwood doesn't recall it because he didn't go down the bank; but I was down two or three times.'

'By Jove, that's something definite,' returned Robert; 'but I noticed several bars crossing the river here and there.'

'Ah! but this one was a slate bar with a seam of quartz running beside it. No flood could alter that, could it?'

'I shouldn't think so,' said Patten.

They left the camp; and in due time they arrived in Keppel Bay, where, leaving the mail-steamer in which they had travelled, they ascended the Fitzroy River in the tender. Robert

stood on the wharf waiting for his luggage to be put ashore, when a hand was laid on his shoulder. He turned to find his half-brother beside him.

'I expected, you Bob,' he said. 'Now, supposing we make this little trip to Bendabar together.'

WITH HER MAJESTY'S MAILS IN MANITOBA.

'GET up, boys!' And amid the merry music of the sleigh-bells and the hearty good-byes of our friends, the wiry little ponies jump away at the crack of the whip, and Her Majesty's mail once more leaves the Birtle post-office on its road to Shellmouth, fifty miles or more away across the snow-clad prairies. At a rattling pace we cross the Bird Tail River, whence the thriving little Manitoban village takes its name; but we soon get a check at the foot of the steep hill leading out of the town, for, like many another settlement in the Far North-West, Birtle lies deep in a hollow sheltered by clustering hills from the none too gentle touch of the biting blizzard. Slowly we climb the ascent, and, stopping awhile at the railway station to take aboard a few parcels, we make all snug, and prepare to face the long stretch of country that lies between us and our destination. It is a clear cold morning, with the mercury registering thirty degrees below zero; and the rising sun, glinting on the earth's fleecy covering with a rich golden hue, imparts to the landscape a charm peculiar to early morning in these cold latitudes; while, from scattered chimneys, the smoke rises in long, straight columns of fluffy gray, observable for miles in such a clear atmosphere as this.

There had been no wind last night, so that the trail is fairly good, and the team lay themselves down to their work as if they enjoy it. Well wrapped up as we are in buffalo robes and skin coats, we begin to enjoy it too, and drink in the keen air in exhilarating draughts. True it is cold, but we feel it no more than we should ten degrees of frost under a murky sky in England. Our driver, an old Londoner, who knows every inch of the fifty-mile trail as well as Piccadilly, is a man of good education, entertaining, and of strong Tory predilections, while we are to democracy inclined; and so, with argument, chat, and reminiscences of the last Riel rebellion, we slip along, and soon have covered the twelve miles to Lansburn. Here we change mail-bags; and in response to the invitation to come in and warm ourselves, we sit awhile by the stove, and take advantage of the heat to enjoy a few whiffs; for, outside, the nicotine will quickly freeze and choke our pipes. We may not stay here long, though, and once more muffling ourselves in our wraps, we leave for Binscarth, the end of the first stage.

After a few miles, it is evident we are getting into a more thickly settled district. Pretty log-houses, each under its sheltering bluff ('Bluff,' in the Canadian North-West, signifies a clump of trees), meet the eye at frequent intervals; whilst

russet-coated cattle, turned out for the warmth of the mid-day sun, pick at the hay thrown over the stackyard fences in evident contentment. Surely this keen air gives one a wonderful appetite; and we are not sorry to see coming in view the farm-buildings of the Binscarth colony, even now getting famed from Winnipeg to the West Coast for its cattle. The last two miles are over a first-rate trail, and soon crossing the railroad, we land at the hotel. Here the driver, who is 'boss of the whole outfit'—that is, sole owner of the rig and the ponies—unhitches, and personally superintends the feeding of his team; and then together we sit down to dinner, served piping hot in a room the grateful warmth of which is very acceptable after our cold drive.

Dinner over, we take a few more whiffs, and then—mail matters having been 'fixed up' meanwhile—we get behind a fresh team, and prepare to meet the twenty-seven miles of the second stage. On every side now the dwelling of the free and independent homesteader meets the eye; and the healthy-looking youngsters stopping in the midst of the 'chores' to look at the mail-stage as it flashes by, seem to tell of comfort and plenty, if not absolute wealth, within. Eight miles out we enter on a stretch of rolling prairie-land. Diminutive hills and tiny dales—like fairy playgrounds—are interspersed with leafless poplar bluffs, pretty enough in summer, and even now pleasantly relieving the monotony of the dead-white prospect. But the snow has drifted badly in these hollows, and now and again the ponies flounder to their knees, and slowly we plough our way through; but once more on rising ground we see Russell in the distance, and a good road over a piece of comparatively flat country soon brings us to the little town with its motley population of old-countrymen, Canadians, and half-breeds. Official work detains us here again for a few minutes, during which we make our way into the store and post-office—the general rendezvous and loafing-place, especially on mail-day—and gather the latest news.

'All aboard!' once more, and we are soon leaving Russell behind us on the last sixteen miles of the journey. On we go, up hill and down over a wretched trail, and through drifts that oftentimes take the little jumper away above the runners, while the air is getting colder as the short winter day begins to close in. Conversation now flags, and, somehow or another, our wraps don't seem so thick as when we started; and how we long to get out and stretch our stiffening limbs! Never mind; there's another twelve miles done, and we comfort ourselves by thinking of 'Jackson's' and tea when—'Hulloa! what's that?' standing out in dark silhouette against the rapidly reddening sky! 'Coyotes! by Jove!' And as a bend in the road brings them right on our flank, and scarce fifty yards away, we count no fewer than seven 'friars in orders gray.' Lean and hungry brutes enough they are, and it is with bitter feelings we recollect we are entirely without 'shooting-irons.' Harmless to man, our vigorous yells soon send them scampering to the right-about, to hunt for a supper off the shy but succulent cony.

We pass Lake Beautiful, and are soon at the top of the hill looking over the luxuriant hay flats of the Assiniboine Valley, and for an instant draw

rein and drink in the restful beauty of the scene, while coachee bursts into poetry:

The day is ending,
The night is descending,
The marsh is frozen,
The river dead.

Through clouds like ashes
The red sun flashes
On village windows
That glimmer red—

he notes, and well he may. The sun is just sinking behind the far bank of the river Assiniboine, leaving behind tiny, many-hued cloudlets, and bars of light, that shade away from ruddy crimson and glorious gold into masses of softest pink and amber; while the snow, catching a thousand luminous tints from the whole range of the western sky, seems to glow with a beauty more than earthly. From afar, the tinkle of the cow-bells and the cries of the herders, mellowed by distance, come floating to us in sweet and musical cadence. But the surly sough of the north-west wind, even now gathering energy for to-morrow's blizzard, bids us hasten; and calling to the team, we descend the hill and hurry across the intervening flat at a pace that soon lands us at the Shellmouth post-office. Many an eager eye on the watch for letters from the dear old home has descried our coming; and the bags safely delivered, we turn to 'Jackson's,' where, with a celerity more than worthy of the old coaching days, kindly hands instantly unhitch and take stablewards the tired ponies, to be fed and tended by their ever-thoughtful owner before even he thinks of his own pressing needs.

What a picture we should make at home in caps, mitts, and huge buffalo coat, with our moustaches solid lumps of ice, and beards and whiskers of a hoary whiteness that old Father Christmas himself might envy! Just now, however, sentiment gives way to supper, and that discussed with true north-western appetites, we gather once more round the stove, and heeding not the blast as it hurtles against the house in impotent fury, we sit and smoke, and with yarn and merry chorus beguile a few hours till sleep—as well beloved as supper—summons us to rest.

Thus, in the depth of winter, some three or more years ago, I travelled with Her Majesty's mail in Manitoba, a journey that was preceded, and has been followed, by many others in different parts of the North American Continent, and accompanying men employed in the same vocation, thereby affording me ample opportunity for observing how the business of mail-carrying is conducted in different localities.

In new countries and in sparsely settled districts it is so frequently attended with difficulty and danger, that the men employed in this service are generally of a resolute and hardy type. In Manitoba and the North-west Territories, the work is usually done by men who own the teams they drive; and a large proportion are old-countrymen, for whom 'running the mail' with its free outdoor life, not wholly unattended with excitement, has untold charms. In the United States, too, I have 'happened across' Englishmen employed in the same capacity; and at one time

I met in Texas a scion of one of our noblest houses riding pony-back with the mails between San Antonio and Bandera, for fifteen dollars a month and his board; and a six-shooter always ready to hand in the not unlikely event of being 'held up by road-agents.' The distance is fifty miles each way; and as the letters left San Antonio every second day, this meant continuous riding for six days, or three hundred miles a week.

In the Great Lone Land, however, the various mail-routes, though often embracing over a hundred miles of country, and conducted alike in scorching heat and intense cold, are entirely free from hostile interruption, and never once in the course of many years' experience did I hear of the mail-robber getting in his work at the expense of the Government.

Occasionally, however, the mail-bags are conveyed by means other than those prescribed by the postal department; and though I have known the gay and festive ox-team pressed into the service, it was not exactly in the hope of gaining additional speed thereby; nor, when the bags are conveyed afoot, does the process quite come up to our notions of how the business ought to be managed.

But these are only exceptional cases. For ordinary work, a light four-wheeled rig drawn by a couple of ponies, and capable of seating one or more passengers in addition to parcels, is the usual thing; and on some routes where passengers and parcels are few and far between, one animal is sufficient to do the work. But in the winter, when the snow lies deep and wheels are unsuitable, a low 'jumper' with broad runners, but quite open, takes the place of buggy or buck-board; and so, keeping himself protected as well as possible from 'winter's cold, wild winds, and drifting snow,' and enveloped in furs, the driver is willing and able to go anywhere and do anything; and a blizzard has to be keen indeed that will scare these sturdy fellows from the trail when duty calls.

THE HOME OF A HERO.

GENERAL GORDON spent nearly all his life abroad, and was accustomed to make himself at home anywhere; nevertheless, it was the house in Rockstone Place, Southampton, until recently occupied by his sister, the late Miss Mary Augusta Gordon, which should be regarded as his real home. Thither his thoughts would often turn, and there he rested after his various expeditions and sojourns in foreign countries.

Rockstone Place is a crescent of white houses, on the heights above the town, overlooking the waters of the Solent and the distant slopes of the Isle of Wight. On the other side of the drive there is a green garden or lawn, planted with ilex and rhododendron, with a screen of elms and shrubbery which partly hides the galvanised iron roofs of the Ordnance Survey offices. The spot is quiet and sequestered, yet with an outlook on the world; and here Gordon, who loved retirement, could refresh his eyes, long used to the sands of the desert and the palms of the tropics, with the verdure of his native land.

The dwelling itself is the middle one of a

group of three, the two smaller forming the wings. A short flight of stone steps leads up to the door, which is set under a small vestibule. Two large plain windows flank the door, one on either side. Besides the green Venetian blinds, these windows are provided with two jalousies or open shutters, painted white, and folded back, each half against the wall. The jalousies give a Southern or Oriental look to the house, and remind one of the tropics. Above them are three other and smaller windows, also having blinds and jalousies. Higher still are the windows of the attic.

In the entrance hall the first thing that struck a visitor was the figure of a young crocodile, oddly fixed to the lintel of the drawing-room door on the left, as though it were running up the wall. It was a real stuffed crocodile, but varnished like the door-post, and resembling a piece of wood-carving. It had been sent home from the Nile by Gordon along with a larger specimen, which had not been kept. How he came by it we do not know, but, curiously enough, it was almost the only hunting trophy one could see, notwithstanding his travels. Perhaps the reason is to be found in the hero's well-known sympathy with animals and tender solicitude for them.

There also were two great spears, presented by King M'Tesa of Uganda. One of them was a parade spear with a flat copper head, and a carved handle, pliant as a cane. The other was a common spear, hafted with wood, and headed with a large double-edged blade. Both were very heavy and strong, much bigger than the Zulu 'assegai' or the Soudan spear, yet they are thrown by the natives with great precision. In a corner of the lobby near the stairs there lay a tom-tom or war-drum, also received from M'Tesa, the large bowl being of copper. It had come to serve the humbler functions of a dinner-gong.

The drawing-room was hung with numerous pictures, and decorated with knick-knacks and works of art, each with a history, and in some way or other associated with his wanderings. The pictures were chiefly landscapes of foreign countries which he had visited, and amongst them were several views of Khartoum, including a photograph of the Government Palace, where he had resided; and a water-colour sketch of the low mud forts of Tutti Island and their solitary palms, a scene on which his eyes must often have rested during his last stay in the country. The sketch was drawn by him, and sent home to Miss Gordon with a small pasteboard box of bullets, which, however, never reached her. The lid of the box was found in the hut where Colonel Stewart is believed to have been killed, at the time the Diaries were recovered, and it still bore the address in Gordon's writing, 'Rockstone Place, Southampton.'

On the other side of the drawing-room were several large photographs, one of them a portrait of the late Khedive of Egypt, presented by himself; the others represented four of Gordon's officers in the Soudan, all in Egyptian uniform, with the red official fez.

In a recess on the right of the fireplace, and as it were amongst these photographs, there was a picture of Gordon himself, painted by Lady Abercromby from a photograph taken in Brussels

while he was over there seeing the king of the Belgians, preparatory, as he then believed, to his departure for the Congo, but in reality, as it turned out, before his sudden despatch to the Soudan on his last mission.

It was a portrait-head of Gordon as he then appeared, clad in a black frock-coat, with a white turn-down collar and a black neck-tie—his usual dress at home. The canvas, though small, presented the head and shoulders life-size, and was surrounded by a rich gilt frame. The likeness was remarkable, and undoubtedly it was one of the finest portraits of the General ever executed. Whoever would see how Gordon looked in the flesh might do so here. The wonderful blue eyes, with their straight open noble gaze, fairly beamed with intelligence and truth. It was rather the look of a bright boy than a man tried in the world as he had been. There was a fascination in the light blue orbs gazing on the spectator as if about to speak to him—the fascination of intellect and perfect goodness. The head was erect, and the look was turned slightly upward. A pleasant expression was diffused all over the kindly face, and lingered in the genial curves of the cheeks and lips. The curly nut-brown hair, with its tinge of gray and gold, was repeated in the short moustache and delicate side-whiskers. The noble brow, so white and high, was very full over the temples, where it was traversed by a bar of care and thought. The strong and sinewy neck was turned to redness by the eastern sun. Any one would say on seeing this canvas that it was the picture of a good man.

Below it, on a small table in the same recess, there was a fine photograph of Lord Charles Beresford in his Soudan uniform; and a smaller one of Lady Beresford. On the wall beside these pictures were some memorial verses to the lamented hero of Khartoum. In the farther corner on the right of the window stood a small painting on porcelain of Gordon in his Chinese costume, with banners hung behind as drapery; the likeness, however, was not particularly good. There were numerous Chinese mementos in this room. On either side of the mantel-piece were two small glass cases, containing the bead necklaces forming part of Gordon's dress as a Mandarin of the Yellow Jacket, beautiful beads of coral and amber, big as marbles, with appendages of pale-green jade. On one of the tables lay his Chinese card-case, a large thin pocket-book of red leather, holding several squares of red tissue-paper inscribed with Chinese characters. This card-case used to be carried before him by a bearer when he went out visiting his Celestial friends.

Opposite the fireplace were a number of relics from the Summer Palace at Pekin, including some exquisite vases of enamelled copper from the Emperor's room. Gordon purchased these articles, as he did not condescend to 'looting,' and sent them to his sister. Amongst them were some grotesque figures cut in jade and rock-crystal; in particular a tablet of milky-green jade delicately carved with a Chinese landscape. On the mantel-piece, side by side with Dresden shepherdesses, were more of these clear crystal figures; and beside the hearth-rug stood a small jade image of a horse, also from the wreck of the Summer Palace. Round the neck of one of the enamelled vases there hung a dingy metal torque, of slender

workmanship, but in shape exactly like the larger and more handsome gold torques worn by the old Gaulish chieftains, and still found in British barrows. A brass crescent and other trinkets were fastened to one end of it, as an amulet. Gordon had this from a black man, who wore it round his neck, and no other dress or ornament. Beside it lay the barbed head of an arrow or dart of the Barri tribe, the barbs, of which there were several, being turned back like hooks from the stem in an ugly catching fashion. There was a bundle of these darts sent home by Gordon, some of them barbed, others plain. They were picked up by him in the woods, where he found a quiverful hanging on a tree, and thinking they belonged to no one, took them with him. The natives, however, discovering their loss, soon after attacked his boat, and a shower of arrows fell around it, some of which struck the boat, and are now, amongst the others, distinguishable by their blunted points.

There were other interesting memorials of Gordon's various life in the drawing-room; for instance, a 'vermilion pencil' such as the Emperor of China signs his decrees with; a cake of red China ink, inscribed with golden letters and figures of the imperial dragon; the vellum Address of the British residents in Shanghai; the central sight of a gun taken by Gordon at the Redan in 1855, and a bullet which struck the front of his cap while he was doing duty in the trenches before Sebastopol.

A photograph of his old officers in the Soudan, most of whom were negroes, and some of them old criminals, would have been difficult to match for sheer hangdog brutishness of feature. 'No matter what they had done, he forgave them,' said Miss Gordon to the writer, one day. 'They do not look like faces to be trusted.' 'He trusted them.' In the same part of the room there was a box of coco-de-mer wood from the Seychelles Islands, made by Gordon himself when he was commandant of that terrestrial paradise, which he considered a vestige of the lost Eden. We may mention here that a walking-stick and a small clock-tower of the same hard streaky wood were presented by the late Miss Gordon to the Kew Gardens Botanical Museum, along with a wax model of the double cocon-nut, made by Gordon himself. Beside the palmwood lay a thing which Gordon prized more than his richer souvenirs—a small slab of reddish-brown stone from the bed-rock of the reputed site of the temple of Solomon at Jerusalem, and the place where Abraham is supposed to have offered up Isaac.

The dining-room on the right of the hall was the room in which Gordon liked to sit. It contained another excellent picture of him, also painted by Lady Abercromby. Some prefer the one in the drawing-room; but Miss Gordon unhesitatingly preferred this one, and considered it a perfect likeness. It was a large half-length portrait of Gordon, dressed in a general officer's uniform, and so placed that it could be seen best in the bright morning light. The attitude was much the same as in the other picture; but the tone was darker and the style stronger. There was the same crispy nut-brown hair, streaked with gray; the same steadfast gaze, but the expression of the eyes was deeper and more thoughtful. If the other picture seemed to show us a good

man, this one presented a great man. In the broad and splendid brow, in the full, keen, and penetrating eyes, we found an evidence of his military genius and power of command. We felt, in fact, that we were looking on a conqueror and a born leader, nay, a king of men. Fearless courage, keen scrutiny, which can look through and through the soul, were here united with the highest powers of administration and resource. It was the head of a great soldier we were looking on, one who was a host in himself, and who might have been the saviour of his country. We felt, too, how incalculable was the loss we had sustained, should the empire ever be attacked by a European power.

So much for a superficial view. But there was more than the great captain in this face. Let us look at these indescribable eyes, which riveted the attention with their magnetic power. Probably no other hero or soldier in ancient or modern times had eyes like Gordon. 'Capsome,' the little dusky slave-boy whom Gordon had freed and brought to England, and whose photograph was in the room, showing his cheek scarred across by a large 'H' branded in the flesh, said to a lady once: 'What! General Gordon! Ain't you afraid of his eyes? He can see in the dark—the light is within.' Truly, there was a light within, a spiritual light, which radiated from his eyes. But there was also a pregnancy of meaning which it is difficult to analyse—a look of inspiration—of divine possession. It gave one the impression of something great, but unknown, a central secret, an inner mystery, like the unknown god of the Greeks. Mere creative genius and force of will would not have inspired that sense of a divine presence.

Gordon would sit for long intervals, looking just like that, in the stuffed armchair on the left of the fireplace. Of what was he thinking? Was he recalling some past scene, or devising some new plan, meditating some point of policy, of doctrine? or was he listening to some inner voice, and seeing some inner vision? We cannot tell. Gordon was more than the hero and the soldier; he was something of the seer and the saint.

Men either good or great are rare; Gordon was evidently both, and hence his power. He attracted alike those who loved the good, and those who admired great talents. A soldier, an engineer, a man of action, he had an influence over practical men of the world, whether soldiers or civilians, which a simple preacher or man of letters cannot readily obtain. His versatile gifts and published writings also attached him to the studious. But if his power over civilised persons, including his intimate friends, was great, so also was it over savage or debased people. We have been told by an eye-witness of his influence over his Chinese soldiers that he 'seemed to make gentlemen of them.'

From these marvellous eyes, so divinely lit as with an internal illumination, we turn towards Gordon's 'Soudan Throne,' a folding armchair he always sat in at Khartoum, and carried with him on his camel journeys. It was a little straight-backed chair, having a skeleton frame of round iron, a carpet back and seat, gilt knobs for ornament, and small pads on the arms for comfort. The carpet had grown dim in the African

sun, and deprived it of all royal pretensions, so that when Gordon returned from his Governorship of the Soudan and suddenly asked, 'Where's my throne? Has it been brought in?' they were all surprised. His throne! Nobody had seen a throne. But at length the camp-stool was found where it had been stowed away. In the Soudan, only Berzati Bey, his interpreter, was allowed the privilege of sitting in this seat of honour, after Gordon. Berzati's photograph was in the dining-room, with an inscription in Gordon's writing: 'For three years my brave and faithful friend, known by European scoffers as the Black Imp, Berzati afterwards fell in the massacre of Hicks Pasha's army.'

Leaving the dining-room and descending the stair, from which a glimpse was got of a pretty back garden, we came to a small unpapered room with an area window opening on the garden. This was a kind of workshop of Gordon, where he would sit and smoke, and pass away the time unpacking and arranging his 'rubbish,' as he called his collections. For the finer things he seemed to care very little, and for the worthless trifles a great deal. On the mantel-piece of this room stood a large tin teapot with which he had made tea for his little protégés at Gravesend, his 'kings' and 'scuttlers,' as he called them. He used to find berths for these little waifs on board ships, and would follow their course at sea from day to day by sticking pins in a large map which hung in his quarters at Gravesend.

Another room of the basement was a kind of study, containing a desk-table, at which he used to write; and in order to guard his privacy, he would put a handkerchief, or hammer, or something outside the door, to signify that he was busy. It was a plain room, like the other, and devoid of all luxury. Gordon smoked a good deal, and chiefly cigarettes from Cairo, but he always went down-stairs to do it.

Gordon's bedroom, on the first floor, was very simply furnished with several cane-bottomed chairs, an ordinary armchair, and a folding deck-lounge with cushions. There were a few pictures on the walls, and over the mantel-piece hung two texts, the upper, in German letters, running:

Oh, ask not thou how shall I bear
The burden of to-morrow,
Sufficient for to-day its care,
Its evil, and its sorrow;
God imparteth by the way
Strength sufficient for the day.

The lower, in black print, was from the Psalm 'Trust in the Lord with all thine heart, and lean not unto thine own understanding. In all thy ways acknowledge Him, and He shall direct thy paths.'

In the dressing-room off the bedchamber were to be seen the lines:

Christ is the word, and spake it.
He took the bread and brake it,
And what that word doth make it,
I do receive and take it.

This room was doubtless the sanctum sanctorum of his home. Here he probably meditated many of his plans, recalled his experiences, and shaped his future course. Here, above all, we may suppose that he gave up his mind to those devotional reflections which formed a large element in his

spiritual life. In the other rooms, or in the garden, he mixed with company, and shared in the world; but here he was most himself; and the visitor was conscious of a feeling that here he was treading upon holy ground.

THE ABORIGINES OF AUSTRALIA.

PERHAPS no country in the world provides a better and fuller illustration of the principle of the survival of the fittest than does Australia. Civilisation and barbarism there came into conflict, and once again the inexorable law of victory to the more adaptable was the result. Unlike the subjugation of the Red Man of America, the victory has been achieved not so much by force of arms as by force of circumstances, and the want of adaptation on the part of the weaker contestants. In bravery and in many other qualities the American Indians were the equals of the whites. Physically and intellectually, the braves of the Far West were far finer men, and, by their surroundings and traditions, were far more fitted to cope with the hated Pale Faces than were the native tribes of the Great Island Continent. Inch by inch the Indians were driven off from their lands, never admitting themselves beaten. Even now, cooped up within their reserves, they as strongly refuse to admit the overlordship of the mighty horde which has spread from end to end of their once boundless happy hunting-grounds, as they did when the Pilgrim Fathers first set foot on Plymouth Rock. They are still strong enough to form a menace to the civilisation which hems them in, firm in the belief that they shall again roam free and unfettered in the land from the Father of Waters to the Setting Sun. Hard as it went against the grain, the Indians again and again gave proof that, if need be, they could adapt themselves to the manners and ideas of their enemies. As surely as the Australian black, the American Indian is doomed to extinction; but whilst the extinction of the latter will be the putting away of a brave nation, dying because of its own unconquerable will, the flickering out of the former will be from far other and lower causes. The great majority of the Red Men disdained alike the virtues and vices of the whites, strong in their native strength and traditions; the Aborigines of Australia, unable to raise themselves to the standard of the new civilisation, and too weak to fight it down, fell only too easy victims to its vices. Indolent and unambitious by nature, they willingly exchanged their precarious existence with freedom for the flesh-pots of serfdom. Their only ambition was for a lazy life and plenty to eat. They soon discovered that to accept food from the settlers was more to their liking than to hunt, fish, or fight; and so they chose to become the miserable hangers-on of the settlements, and imitators of the white man's vices.

Several causes helped to this easy surrender of freedom. Whereas the American Indian lived in a land of varied beauty—rushing rivers, endless lakes, wide-reaching grassy plains, and rugged mountains—where wild animals, birds, and fish were plentiful, and in a climate which called forth all his energies and ingenuity to battle with, the Australian aborigine was the child of

the monotonous bushland, of dismal plains and drought-wasted, sluggish rivers, where food of all kinds was comparatively scarce and inferior. What he gained from the warmer, sloth-breeding climate, he more than lost by want of vigour and the need for adaptability. Nature forms her children after her own likeness. Country and climate stamped the Indian a valiant, unconquered patriot; the Australian black, if not a slave, a weak dependent. Then, too, the whites with whom these two nations first came in contact, and from whom they received their earliest impressions, were of a widely differing mould. The pioneer settlers of America were strong, earnest men, men of conscience, the picked manhood of England; the first settlers in Australia were the scum of the English nation, the refuse of the prisons. If the Pilgrim Fathers struck hard blows and carried things with a high hand, they did it as men of purpose. Like the men who rebuilt Jerusalem, with one hand they wrought, and with the other they fought, fighting and working alike to the glory of their God and their religion.

They brought with them none of the tempting vitiating vices so alluring to the savage nature. The opening chapter of Australian history is one of the vilest pages ever written. A horde of men steeped in every crime were turned loose in the country—men who for the most part gloried in debasing themselves and in debasing all with whom they came in contact. Hard fighting and stern religiousness were the factors in the settlement of America: rum and vice in that of Australia. The differing results accorded with the different beginnings.

The blacks of Australia, however, did not succumb altogether without a struggle. They resented the intrusion of the new comers; but the struggle was for the most part one of cunning and cruelty rather than a brave resistance. It took the form of treacherous reprisals for injuries received or supposed to have been received; it never approached to a combined struggle for freedom. The outer line of settlement was a sort of skirmishing ground where a half-hearted resistance and continuous cattle-raiding on the one hand, and land-grabbing and the dishonouring of the native women on the other, engendered bad feeling, and led to innumerable bloody murders. The early squatters undoubtedly ran many risks from their treacherous foes. The blacks, however, were generally to be won over by a little judicious handling and feeding. Much of the treachery was the outcome of the treatment they had received at the hands of the whites, who scrupled little to shoot down the aborigines like beasts, the 'lifting' or disturbing of a few cattle being considered a sufficient excuse for declaring war against the whole tribe. In some districts the war was one of extermination. Boomerang, waddy, and spear, never so deftly wielded, were no match for firearms. Might was right, and treachery counted little against salt-petre.

The settlement of the country meant its conquest. Once within the line of civilisation, what little power the aborigines had possessed was broken. Equally unable to breast or adapt themselves to the new order of things, their tribal compacts broken, their land gone, the animals on

which they had depended for food displaced by sheep and cattle, it only remained for the blacks to become the creatures of their dispossessors, the recipients of their charity. In all parts of Australia where the country is in any degree settled, this is the position which they now occupy. The old order of things still holds good in the 'new,' little-explored country of Central Australia, the northern part of West Australia, the Northern Territory and some parts of the 'Gulf' (Carpentaria) country. Cattle-stealing and occasional murders are heard of amongst the 'wild' blacks, who still sometimes hold their tribal 'corroborees,' and are responsible for considerable trouble.

Captain Phillip, the first governor of Australia, writing about 1790, not long after the settlement of the country, computed the number of aborigines at one million. He based his computation on the fact that there were some three thousand in the districts then known, a ratio that would give a million for the whole continent. This was merely a guess, but probably was not so very far wide of the mark. The estimate of other and later authorities is much lower. The census of 1881 gave the number of aborigines at thirty-one thousand seven hundred. This number, however, represented only the 'civilised' blacks, and the true number is supposed to have been two hundred thousand. From these figures it will be seen that the decrease is steadily but surely going on, and that the time when the Australian black shall have been 'improved' off the face of the earth can be pretty accurately worked out by rule of three. In Tasmania, the end has already come, the last of the island aborigines having died in 1876. On the Continent, after the pure bloods have died out, some characteristics of the decayed people will linger on in the half-breeds.

If the aborigines have been sufferers by the influx of the whites, they have also in some degree been gainers. The Governments of the several colonies have always more or less recognised their obligations to the original possessors of the soil. For many years there has been an annual distribution of blankets and other necessities. Mission stations have also been established by Government and private funds in different parts of the country, where as many of the blacks as are willing to conform to the mild rules laid down for the conduct of the establishments are housed, fed, and taught. Their want of constraint, and their instinct for a free roaming life, however, generally weigh more heavily than does even their liking for regular rations and a lazy life. The majority prefer to become hangers-on about the townships and stations, eking out existence by begging and doing odd jobs. Every station and township has its little band of black-fellows and their 'gins,' who wander about in wonderful assortments of the cast-off clothing of the whites, begging from every one, and not always clearly distinguishing between 'meum' and 'tuum.' 'Bacca' and six-pences are what they most favour, but nothing at all comes wrong. The men and women are alike inordinately fond of tobacco and intoxicants. This fondness for drink has had not a little to do with their downfall. It is a pitiable sight to see the poor creatures loafing about the hotels, begging and praying for the maddening poison

which they know too well is fast destroying them. Once having acquired the vices of the whites, their ruin is swift. A few, but not many, are employed as cattle-men, shepherds, and general helps about the stations. They are also drafted into the police force as mounted troopers and trackers, and have done and are doing some splendid service in hunting down criminals who escape to the bush. Many are fine runners and athletes, but since abandoning the old wild life, their prowess in these respects is waning.

Mission-work amongst the blacks cannot be said to have been successful. Undoubtedly, good work has been done by the devoted missionaries who have spent their lives in trying to raise and enlighten the native tribes. The low type of intellect, the shiftless, aimless life, the wandering habits, the traditional instincts of the aborigines, and the too often evil example set them by the rough settlers, have been hard to overcome. Some few have truly embraced Christianity; but with the majority—as with many other so-called converted heathens—it must be sorrowfully confessed that their acceptance of religion has been from interested motives. They are like children—easily pleased with anything new. The mission-work shows best on paper. The children, however, give better promise.

The day of the black-fellows has gone, and gone for ever. Whilst the Great Sunny South Land was hidden away amongst the secrets of the sea, he was her fitting lord and master. But the time came when she should sweep 'into the younger day.' Nature had prepared for the change, but he had not. She was ready for the great wave of advancement, but he was not; and so he was swept away before it. One hundred years have gone by since the war of races commenced in Australia. Probably before another century, or century and a half, has ended, the last of the Australian aborigines will have died out, and the memory of the black man will linger only in the liquid music of the native names which everywhere dot the map of the Island Continent, and which, happily, the Anglo-Saxon has the good taste to prefer to his own more commonplace nomenclature.

TRAGEDY.

A SKETCH.

Alone! the loneliness,
When our own sin has shut the doors of home,
And we are left without—the deepening gray
Of twilight lying chill upon the old
Remembered paths, and the long night of death
Already creeping o'er the eastern edge
Of a deserted world. The fireside glow
Strikes through the casement, and the children play
About the settle of the ingle nook,
The grandsire nodding by the cheerful blaze;
But if there falls a shadow on the pane,
It is the ivy or the slanted rain;
And if a sob breaks in upon the laugh,
It is the wind among the apple boughs—
This is the righteous punishment of sin.

WHAT IS WEALTH?

THE frequent discussions which from time to time take place in magazines and elsewhere, as to the proper uses of Wealth, suggest the question—What is Wealth? And to that question there seems to be no more comprehensive and definite answer than there was to Pilate's interrogation on the subject of Truth. To be 'rich beyond the dreams of avarice' is a favourite figure of speech, but we may well doubt if the position is capable of realisation, when one regards the stupendous fortunes of some of the American kings of finance.

The truth as to wealth seems to be that it is actually a relative term. In plain words, it is the excess of realisable value which a man possesses above his normal requirements. But when the excess becomes excessive, then it becomes incomprehensible by the majority of men. Thus, to a man with one pound a week, two pounds a week will seem riches, because it implies a large margin for accumulation; but to this man a figure of wealth represented by the numerals £5,000,000 is a mere figure of speech. He can no more grasp its significance than a man who is colour-blind can appreciate the unspeakable glory of the sunset or the dawn. Even richer men than he can find no tangible meaning in such figures.

Wealth, in fact, is not the mere possession of anything in abundance, but the possession in abundance of that which can be used. Midas, at whose fabled touch everything turned into gold, was not wealthy in the true sense, because he could not use what he produced. It is usual to employ his case in pointing the moral against the love of money; but, as a matter of fact, Midas would have been quite as sorely afflicted had his touch transformed everything into sheaves of corn, or joints of beef, or new hats. And thus it is that the conception of wealth must vary with circumstance as well as with individual.

The new 'Gospel of Wealth,' of which so much has been heard of late, is, in essence, this—that it is good for everybody that wealth should be concentrated in few hands. It has been said that

it is better that one man should have one thousand pounds to spend, than that a thousand men should have one pound apiece. It is probable that the weight of opinion against this proposition will be pretty much as a thousand to one, and for very adequate reasons.

The attraction of wealth to the intelligent human creature is twofold. There is the pleasure of winning; and there is the joy of possessing. Now, the joy of possession may be as keen to the owner of a thousand pounds as to the owner of a thousand thousands; but the pleasure of winning is certainly open to all in equal degree, even to the owner of a single pound. No keener enjoyment is possible to the rational animal than persistent effort suffused with perennial hope. This is but to say that the pursuit of wealth gives pleasure to millions; whereas the possession gives a dubious joy only to thousands. According to 'the New Gospel,' these millions have no right to this enjoyment, if one rich man can do more towards the greatest happiness of the greatest number than a thousand men who are not rich. The proposition, however, ignores the absolute and unalterable fact that the nine hundred and ninety-nine men who are debarred from the pursuit of wealth are deprived of the greatest material happiness possible to them.

Upon this hypothesis, the concentration of wealth in a few hands has the very reverse effect of helping towards the greatest happiness of the greatest number, however wise and beneficent in the administration of their wealth may be the possessors. Wisdom, however, is exceptional among those who have made their wealth rapidly. When a man's fortune has grown more rapidly than his intellect or his conscience, the consequences must always be injurious to himself as well as to society. And that is not all. It is not possible for any one man, however wise and beneficent, to administer to the best and fullest uses such fortunes as have been piled up by some men in our time.

It is worth while taking a look at the accumulated wealth of some American millionaires, and

we select them in illustration for two reasons. In the first place, the statistics of such matters are more complete and accessible in America than they are here. And in the second place, there are very few persons in this country whose capitalised means equal those of the transatlantic money kings. Again, in this country accumulation is the work of a lifetime, or even of generations; while in America it has been frequently the work of a few years. The fortunate beings who suddenly 'strike it,' or discover 'a pocket,' form a factor in the greatest economic problem of the age, without knowing it.

By a calculation made a year or two ago by an American statistician, it seems that seventy citizens of the United States possessed among them an aggregate wealth of 540 million pounds. That gives an average of about $7\frac{1}{2}$ million pounds apiece. To come to particulars. There was one estate—we refrain here from mentioning names—returned as worth no less than 30 million. There were five individuals valued at 20 million; one valued at 14 million; two valued at 12 million; six valued at 10 million; six valued at 8 million; four valued at 7 million; thirteen valued at 6 million; ten valued at 5 million; four valued at $4\frac{1}{2}$ million; and fifteen valued at 4 million.

The brain reels before such figures. They express measures of wealth which the ordinary mortal is powerless to grasp.

Besides these seventy colossal fortunes, there are fifty other persons in the Northern States alone valued at over 2 million each—thirty of them being valued in all at 90 million. There were some little time ago published lists of sixty-three millionaires in Pennsylvania possessing in the aggregate 600 million, and of sixty persons in three villages near New York whose wealth aggregated 100 million. In Boston, fifty families pay taxes on annual incomes of about £200,000 each.

We have nothing to compare with such individual cases of wealth in Great Britain. Baron Rothschild and Lord Overstone each left about $3\frac{1}{2}$ million; the late Lord Dudley left 4 million; the late Duke of Buccleuch, esteemed the richest Scotchman, left estates valued at 6 million. One living English Duke is valued at 10 million, and another at 8 million; but not many names could be added to these, to place against the above list of American fortunes. In 1884 there were only one hundred and four persons in the United Kingdom whose incomes from business profits were returned as over £50,000 a year. In 1886 there were only seventeen estates which paid Probate Duty on about a quarter of a million each.

There is another interesting feature in the relative distribution of wealth in the two countries. By Mr Goschen's analysis of the income tax returns, it was found that in ten years the number of incomes paying duty on up to £500 had risen 21·4 per cent.; those between £500 and £1000 had not increased at all; those between £1000 and £5000 had decreased 2·4 per cent.; and those over £5000 had decreased 2·2 per cent. According to Mulhall's estimate in 1877, £7,770,600,000 of British wealth was distributed among 6,676,000 families; and two-thirds of it was owned by 222,500 families.

The statistics of the United States show quite other results. They prove not only that the wealthy class there is enormously wealthier than the wealthiest class of Great Britain, but also that the wealth of the country is in much fewer hands. Mr Thomas G. Shearman estimates the average annual income of the richest hundred Americans at about £300,000; and the average annual income of the richest hundred Englishmen at about £90,000. The earnings of fully four-fifths of American families do not average, he says, £100 per annum. According to the estimates of the wealth of American millionaires, it seems that 25,000 persons own one-half of the entire wealth of the United States; and if the present rates of taxation and accumulation continue, it is computed that that great country will be practically owned by about 50,000 persons—say one-thousandth part of the present population.

We have cited these figures because they carry on the face of them the refutation of the new doctrine that it is good for the world that wealth should be concentrated in few hands. That one hundred and twenty persons in the United States should possess among them an aggregate capital equal to the entire National Debt of Great Britain is a remarkable fact, which cannot but have vast economic and ethical significance. For it is not conceivable that these hundred and twenty persons can so administer such a fund as, say, 120,000 persons, with smaller proportionate shares in it.

And then as regards the possession of wealth, the means by which it has been acquired cannot be disregarded. It is not to be assumed that all millionaires have made their fortunes by wholesome industry, affording employment and happiness to many thousands during its accumulation. Many of the American fortunes have been made under the shelter of the strict system of Protection, which that country preserves—that is to say, may have been drawn out of the pockets of the people by the deliberate consent and contrivance of the people themselves. Other fortunes have been made by lucky hits in mining, &c., and are to a large extent the products of chance. Others have been made by a clever, even daring speculation in various departments of commerce and finance. Others, unhappily, by the unscrupulous use of capital in rigging and manipulating markets, to the serious loss of the community.

We are not going to discuss the ethics of the question, but merely suggest that if wealth has not been accumulated by means which sanctify its possession, then it certainly cannot be in the best hands for putting it to uses tending to the greatest happiness of the greatest number. Mr Andrew Carnegie will certainly not find many millionaires to agree with him, that the man who dies rich is 'disgraced.' The aspiration of most men, indeed, is to leave behind them as much as possible. And the fact is that it is not practicable for the man of millions to dispense his wealth during his lifetime. Life is so uncertain, and in order to avoid dying 'disgraced,' he would have each day to dispense in some way the earnings of each day, and he could not possibly do it, even if he wanted.

As to the uses to which accumulated wealth may be or should be put, we shall say nothing

here. The subject is too vast and complicated. But a word in conclusion may be offered on the ethical aspect of wealth.

The desire and the longing for that which is expressed in the word *Wealth* has been from all time, and will be for all time. It is deep-rooted in the heart of man, and it is not necessarily a sordid longing. The desire for wealth does not imply that mere greed and yearning for the possession of gold. It means a great deal more, for it springs from the idea that wealth not only gives power but also happiness. People, not being misers, desire money because they believe, or suppose, that money can enable them to obtain certain articles which will contribute to happiness.

So far good; but the experience of mankind is that there is more happiness to be derived in the pursuit of wealth than in the possession of it. The root of happiness is in the mind, not without; and by the healthy organism, it is found rather in hopeful and manly endeavour, than in placid contentment with surroundings. Pleasure may pall by familiarity; but there is no limit to the pleasures of hope. It is possible, even, that the sordid gold-hunter and ignoble money-grubber has a sort of happiness of his own; but he is not the sort of being we are considering. The pursuit of riches by honourable effort as a means to an end—namely, happiness and the power to bestow happiness—is a perfectly legitimate and rational one. But the worst of it is that we all too much associate money with happiness, and act as if the one term connoted the other. In the haste to be rich, men so often forget to be just—and sometimes even honest—while they lose in the race the faculty of being happy at the end of it. We cannot understand the nature and attributes and responsibilities of wealth aright, if we do not distinguish between money-making as a means to an end, and accumulation for the mere sake of possession.

POMONA.*

CHAPTER XVIII.

The time of pleasant fancies
For lass and lad returns
In velvet on the pansies,
In little rolled-up ferns.

LORD DE TABLEY.

'Oh, Sage, I wish I was you! You are the very happiest, luckiest person in the world.'

Kitty was watching Sage dress with feelings of the deepest dejection.

'It does seem so unfair that you should have a cousin all to yourself. I'm sure you can have a share of our cousins, and my share in them as well, for I can't bear any of them. And I'm quite sure Miss Lambert would put me up into a higher class if I could say, "My aunt, Lady Lester, wishes it;" but I might talk of my aunt Mrs Wilson for half an hour, and no one would pay the least attention. And I do not think, Sage, that Aunt Maria is at all a nice aunt for any one to have, and so tiresome about putting one's elbows on the table.'

'Dear, little Kit, I wish I could give you a share.'

'Well, Sage, I do think you might let me stay at home from school to-day to see Pomona. And I do think I've got a headache; and you know I did not eat half so much bread and butter at breakfast as usual; and I think my tongue is very bad,' said Kitty, examining critically a very red little member in Sage's glass.

'I wish you might, Kit; but father made such a point of your going to school, and he will be vexed if you don't.'

A slight cloud dimmed the brightness of Sage's face, for this was the one drop of bitterness in her cup, that father was by no means so pleased as Sage was at Pomona's appearance, and at this restoration, or rather beginning, of friendly relations between Sage and her mother's family. Perhaps he still nourished resentment of their treatment of his wife; and what he would have welcomed gladly for her sake, though never for his own, he almost resented, now that it had come years too late to gladden her gentle heart; but he could not find it in his heart to pour cold-water on Sage's pleasure, only he listened a little grimly to her glowing descriptions of Pomona's beauty and sweet graciousness, resolving in his inmost mind that the olive branch held out so tardily should only be received by Sage herself, and should not, however willingly it might be done, be extended to himself or his other children. And so, to-day, when Pomona was coming to fetch Sage to take her down to Beechfield, Dr Merridew's professional duties suddenly assumed an engrossing importance they did not always present; and he also harangued his family all through breakfast on the necessity of regular attendance at school; and he was quite cross because Sage suggested that Nigel had coughed in the night.

He would not, he told himself, stand in Sage's way; her mother might have liked her to know the old home which, from the fact that his wife had never dilated on its attractions, had grown in his imagination to a very Paradise, from which, for his sake, she had been banished. It was only right that Sage should know her mother's birthplace and her mother's people; but with Sage it must stop; neither he nor his other children should reap the smallest advantage from the Lesters, even though, by so declining all intercourse, it should separate them somewhat from their own little Sage.

And perhaps he felt—though he was not at all inclined to worldly wisdom—that it might be good for Sage as regards Maurice and his family. It galled him a little now and then to think that Maurice's people might look down on his little girl; and perhaps these fine relations of whom he would have made no mention while they kept aloof, might raise her in the estimation of the Moores.

He did not tell Sage anything of this; but she guessed a little of it, and sometimes debated if she would not draw back and resist Pomona's fascinations, and dwell among her own people, the proud, shabby, little people of Dalston, among whom her life's happiness had found her. But there was no resisting Pomona, or being surly or proud or independent with her; and she could only hope that some day father would

be brought, even against his will, under her sunny influence, when she was quite sure he would fall a victim.

And yet—and yet Mr Ludlow had not done so. That introduction had been altogether a disappointment; and she was almost sure the painter's sudden return to Scar had been in consequence of his meeting with Pomona. It seemed even to have taken away his pleasure in the picture; and he did not go again to see it after his hurried visit on the way from the station, though he had promised to take Kitty the very first day of his return to London.

So perhaps Dr Merriew might not be so fascinated as she was; and how would Maurice like her? or, rather, how did he like her? for Pomona said she had met him, and it must have been at that dinner-party of which he had told her so little. Maurice had not yet returned to London. He was still staying with his old uncle in Sussex; but how much longer he would remain Sage did not know, as the letter she carefully transferred to her pocket when she changed her dress was dated some days back, and did not say which day he should return—so he might; who could tell?—be coming that very day, and she would be away. This was another little drop of bitterness; but, after all, what are two drops in a cup so overflowing with sweetness? for Sage was inclined to agree with Kitty's envious statement that she was the very happiest, luckiest person in the world. She had not told Maurice anything about Pomona's visit; she was reserving all this new, interesting episode in her life to describe to him when he came back, and only made mysterious allusions to it in her letters.

But to-day she was going down to Beechfield; and though she would have been happier if she had had a more recent letter of Maurice's in her pocket, the want of it was not enough to spoil the pleasure of the beautiful May day.

Poor, unwilling, envious Kitty was packed off to school; and Sage was ready, even to the last button of the beautiful gloves Maurice had given her, when the carriage came round the corner, the very sound of the wheels and the stepping of the horses' feet being different somehow from the usual vehicles and horses that passed unnoticed every day.

'And if the carriage were different from those usually seen in Dalston, so, too, was the lovely bright face within, all eager and smiling as Sage came out.

'Mayn't I come in and see Kitty?' she said. 'I want to see if she is like the picture, and I have brought her a box of chocolates. I am sure that little girl in the picture likes chocolates. Next time we go to Beechfield, she must come too. I do love taking a child there—they are as happy there as the day is long, as I used to be as a child; and indeed I am the same now.—Oh, Sage, I hope you will like it—it is such a dear old place. You can't help liking mother—every one does. I hope it will be one of her good days, when she can come down or out on to the terrace. It is so warm and sunny to-day; I should think she might venture out.—It is my birthday to-day, do you know, Sage? I am twenty to-day, and I am a week older than you; so I am out of my teens, and you are not; so I shall take care of you and chaperone you. We had a heap of invi-

tations for to-day, and some of them nice ones; but I always spend my birthday with mother; so I refused them all. Lady Charteris looked a little black at me, but I did not care. I told mother that wild horses should not keep me away on my birthday; and this is a real proper birthday, with the apple blossom all out, to make up for my ridiculous name.'

Pomona was in high spirits, and she went on talking gaily while the carriage was taking them to Victoria Station; and Sage was well content to listen.

'There is some present awaiting me at Beechfield; but I don't quite know what it is; but it is sure to be exactly what I like best. Mother has a most wonderful way of finding out what I want, and she knows I don't care for jewellery.—Do you know, Sage, I've never cared for jewellery since I was a little wee bit of a child. I had set my heart on a small blue enamel locket, and cried because mother did not give it me. I fancy it was really a trumpery, little thing, and the nurse I had then, to comfort me, said, "Never mind; you'll have all the Lester diamonds one day of your very own;" and I was full of the idea, and went running to mother to ask if it was true, and if it would be soon; and mother told me it was quite true, and it might perhaps be very soon, for it would be when she died.—Oh, Sage, I remember how I cried; and I hated the sight of diamonds for ever so long; and even now, I haven't quite got over the feeling, though I have had some given me, and see how beautiful they are. Lady Charteris gave me a lovely star this morning—a beauty. I have brought it with me to show to mother; and you must see it; but I know mother's present will be something I shall like much better.—Sage, how I do go on talking, and you so quiet! I think there is something about you that makes one talk, you have such a listening face. One does not feel that you are only listening out of politeness, as most girls do, and are only paying half attention, and thinking of something else, or criticising one's dress and appearance.'

'But I am doing that too,' said Sage; 'I am thinking all the time how nice and sweet you look.'

'You are a wicked, little flatterer, and you do it with such a truthful look, that one cannot disbelieve you.'

'Mr Ludlow always says I am such a good listener; but it really is because I am so interested in what he says.'

'Oh, Mr Ludlow!'—a slight cloud passed over Pomona's bright face at the painter's name. 'He is so fond of you, Sage. I wonder why he took such a dislike to poor me, and I must be like his wife too, since the picture is so like me.'

But Sage could offer no explanation except that she thought Mr Ludlow was not well, as he had gone back to Scar next day.

But they had reached Victoria by this time, the scene so often of frantic departures of the Merriew family. After an hour's quick run through beautiful May country, incredibly green beyond the wildest, gaudiest colouring of the most audacious landscape painter, Hillston, the station for Beechfield, is reached; and Pomona recognises a smart groom in tops with the cordiality due to the person who put her first on her shaggy, little

Shetland pony, and who has followed her since over hedges and ditches, and through, I am afraid, more hare-brained adventures than always came to the ears of Lady Lester. He had even now a painful struggle between respect and affection, and a tendency to call her 'Missy,' and say 'Lor bless you!' and to grin wider than is becoming to a gentleman's servant, and to forget to put his finger to his hat at regular intervals; and he had an inclination to lean over from the back seat of the little phaeton that met them at the station, and volunteer remarks on the ponies, or other interesting stable news, instead of sitting up with crossed arms in wooden silence. But no wonder he talked about the ponies, for they were Lady Lester's birthday present to Pomona, and as beautiful a little pair as ever stepped, perfectly matched chestnuts, with plenty of life and action, picking up their dainty feet so prettily, and tossing their spirited, little heads as if life were a good joke, and the little carriage behind them a mere feather's weight.

I am afraid, as regards the ponies, Pomona found Sage for the first time a little unsatisfactory, for much as she admired them, there was no disguising that the admiration was ignorant, for Sage's experience had lain principally among cab and omnibus horses, and even these she had not known intimately; and the feeling chiefly called forth in such experience was that of pity. At Scar, there had been some cart-horses on which, when they went down to drink at the pond, Kitty and the boys used to ride, and these had endearing qualities and large hairy feet; and there was a baby donkey with woolly legs very close together, and a short innocent nose, and a bang of hair on his forehead, like an American girl, which frisked about round its patient, old mother in a manner delightful to behold.

But Sage felt that to mention a young donkey *apropos* of Pomona's ponies might have been taken as an insult; so she wisely refrained; and Stokes, in the back seat, having more knowledge on the subject, presumed on his privilege as an old servant to lean forward and expatiate on their beauties; while Sage drank in all the charms of the road along which the ponies were taking them, as it seemed to her, all too quickly.

The country in May was full of novelty to Sage, as holiday-time does not come till August; and I do not think, if these ponies had not stepped so briskly, Pomona would have got her many yards away from the little station, so lovely was the lane leading up from it, with high banks clad with young green things, that by August have grown dull and dusty.

But Pomona's ponies go too fast for me to describe half the beauties of the way: the little beetle-browed, thatched cottages, garlanded with white clematis; the farms peeping out from among the apple blossom, across broad green meadows striped and fragrant from the big iron roller, whose musical jangle made the ponies prick their ears and listen.

'Here we are!' said Pomona as they turn in at a gate by a pretty, trim lodge, out of which a smiling woman in a white apron runs to open for them to pass in; and Sage gave a little sigh to think that the drive was over.

But 'Here we are' at Beechfield means something different from 'Here we are' in John

Street, where a couple of steps will take you from the street door to the hearthstone; and there were yet three miles to drive, and by far the loveliest half of the drive, through the beautiful park.

I think the deer formed the culminating point of the day to Sage; and after them the house with its stately front of gray stone, clothed at one end with a mantle of shining ivy; and the broad drive that led to it through great banks of rhododendron, hardly stirred any feeling of admiration in her; and it was of the deer she thought when she said to Pomona, as they went up the wide stone steps at the entrance: 'How proud you must be of it all! and to think it will all belong to you one day!'

And Pomona laughed, and then sighed. 'I suppose I am proud of it; at any rate, I am very fond of it. But as to its belonging to me one day—well, you see, dear, it is like the diamonds—I would rather not have it.'

'Oh! Pomona, I am sorry'—

'No; don't be sorry. How can you know what I feel about mother, when you lost yours so long ago!'

After all, talk as we may of the inequalities of life, one is struck now and then by the strangely even balance. If you extract the pure happiness from each one's life, it is surprising how little more you get from boiling down all the heaped-up possessions and riches and glories of one man's opulent life, than you do from the few poor, insignificant possessions of another. Pomona's happiness largely consisted in the frail life and tender love of her mother; surely, in the poorest Whitechapel slum, there may be found like material for happiness.

(To be continued.)

THE HONEY-BEE OF THE FUTURE.

THE Americans, who, like the Athenians of old, are ever on the watch for something new, are reported to be endeavouring to alter the character of the 'little busy bee' by applying to it the principle of artificial selection, in order to make it a useful servant, devoid of sting, yet capable of producing a much larger store of honey than heretofore. We are apt to overlook that interdependence of animal and plant life in the economy of nature, of which Darwin gave a curious instance in his well-known assertion that the number of cats kept in a district would influence the growth of red clover. The reason assigned for this singular connection between the carnivorous animal and the plant is that the cats keep down the mice which destroy the nests of the humble-bees, and as the red clover is fertilised only by humble-bees, it follows that when mice abound, humble-bees are scarce, and so is red clover; but when the mice are killed by cats, the humble-bees have a good time, and spend it in sucking the honey from the red clover. In so doing, they convey the pollen from flower to flower, and thus effect the fertilisation necessary to enable it to produce perfect seeds.

Now the reason why the red clover is thus

dependent upon the good offices of the humble-bee is, that the proboscis of the common hive-bee is not long enough to reach the nectary. The American apiculturist therefore proposes to cross the hive-bee with the giant bee of India, in order to lengthen the proboscis, and so enable it to rifle the nectary of the red clover, thus adding to its food-supply; and by another cross with stingless bees, an effort would be made to get rid of that troublesome sting, which renders the manipulation of a swarm of bees a little difficult and sometimes dangerous.

Both these modifications may be possible, but it is doubtful whether both would be equally useful. A bee's sting is a weapon both of defence and offence; and although its use generally means death to its owner, it is employed much more freely than is agreeable to the recipient. Cases, indeed, are on record in which a swarm of bees, angered by some unknown cause, have attacked men and horses and caused death; whilst even the sting of a single bee has been known to be fatal when received in the throat or in some great nerve-centre; nevertheless, it seems to be an accepted fact that the sting of the bee is a remedy for rheumatism; and the 'Mediterranean Naturalist' asserts that the people of Malta have long been accustomed to expose themselves to be stung by bees for the cure of this painful disease, with excellent results. It is well known among our peasantry that any one who has been frequently stung feels no ill effect from further stings for years after, and this would seem to afford an opening for medical investigation into the properties and uses of the bee-poison. Certain scents appear to madden bees; one of these is a sweating horse, which is so obnoxious to them that it has happened not infrequently that horses tied up near a hive or a nest of wild-bees have been attacked furiously, and if not cut loose quickly, have been stung to death.

Whether the bees of South Africa are peculiarly savage or hypersensitive, we do not know; but many instances of horses stung to death are recorded from that part of the world. They certainly seem to be very easily offended, for we have been told of an instance in which a mischievous little naked Kaffir boy chewed a carrot and spat it out at the door of a hive; whereupon the bees immediately attacked him, and would inevitably have killed him, had not the gardener thrown him into a trench he was digging and covered him up quickly with earth; and it may be here remarked that fresh mould is one of the best known remedies for the stings of bees or wasps.

When, therefore, American apiculturists propose to deprive bees of their stings by crossing them with the wild stingless bees, of which at least two distinct species are known in America, it would seem as though they were working for a noble object. 'If we had a race of stingless bees,' they say, 'the value of the honey crop would be doubled.' But it is well to pause and deliberate before attempting to deprive the insect of the formidable weapon provided for it by nature.

Bees have many enemies, and therefore undoubtedly require a defensive weapon; but there is reason to suppose that the sting is something more than that.

It is acknowledged that stingless bees are not much good as honey-gatherers, and Linnholtz, the Swedish naturalist, says of the honey produced by the stingless bees of Australia, that it causes diarrhoea, and is sour and soon fermented because the bees have no poison to preserve it. Probably, therefore, if our bees should be deprived of their stings, the honey made by them would be worthless instead of gaining in value; for the sting apparently is not only a weapon of offence and defence, but an alembic in which is distilled a subtle fluid, a drop of which is added to each cell of honey before it is sealed, and which, although poisonous when injected into the blood of man or other animal, is essential not only to the well-being of the insect, but also to the wholesomeness of the food provided for its own use and that of its progeny, and which is so unscrupulously appropriated by omnivorous man. The value of the sting to the bee is exemplified by the fact recorded by Darwin, that since the introduction of the common hive-bees into Australia they have almost exterminated the native stingless species.

In these days of cheap sugar we can hardly appreciate the extreme importance of honey and the honey-bee to the ancients. The land flowing with milk and honey loses half its significance to those who look upon honey as dainty desired chiefly by children; and notwithstanding the great revival of bee-keeping of late, it is extremely doubtful whether the public taste will ever return to its ancient delight in that which has become a luxury instead of a necessity. The Americans say the consumption of honey in the United States is only eight ounces per annum for each person, because people have not yet learned the use of it; and English bee-keepers complain that they are overstocked and cannot sell all their produce; and yet it is affirmed that a good deal of artificial honey and honeycomb finds its way into the market.

Much of the honey which in Switzerland is an invariable accompaniment to the breakfast of bread, butter, and coffee, is said to be spurious; yet with the rows upon rows of beehives everywhere, and the abundance of mountain flowers, one would suppose the manufacture of artificial honey to be quite unnecessary; but in the pre-sugar era, the making of false honey was an art recorded by Herodotus with praise. It was the confectioners of Callatebus, on the Mæander, who thus secured fame to themselves by manufacturing honey from tamarisk and wheat. The ingredients now employed by artificial-honey makers are not made public, but honey supposed to be gathered by bees from certain flowers exclusively, is largely advertised as remedial for various diseases. Thus, eucalyptus honey is much used in America as a cure for consumption, and so is that made from horehound, but probably in both cases the medicinal properties are added by human manipulators. Tennyson writes of the 'honey of poison-flowers;' but we never heard of any one having been poisoned by honey, although that made from the euphorbia in South Africa is hot and disagreeable to the taste, and probably unwhole-

some; and the honey made in India from the flowers of the rhododendron is said to be poisonous; so that we may infer that the qualities of the flowers rifled are to a certain extent imparted to the honey, which undoubtedly varies considerably in flavour. The honey of Mount Hymettus, so famous of old, is still most delicious, and so is the heather-honey of Scotland.

When, therefore, apiculturists have succeeded in breeding a race of bees able to suck the nectar from the red clover, our honey will doubtless be improved in flavour. The Ligurian bees are said to possess the desired length of proboscis, and if these are the bees of Hymettus, we may perhaps have a clue to the excellence of their product. British bee-keepers have long imported Ligurian queen-bees, with the view of improving our native stock, but so far the success of the experiment remains uncertain.

It is hard, indeed, to realise the fact that for thousands of years the whole world depended entirely upon the product of the honey-bee for all the sweetness required in cookery. The numerous allusions to honey in the Bible and among classical writers will be familiar to many people; and among the most ancient of British pottery, antiquaries find perforated vessels, supposed to have been used for straining honey. But perhaps it is not generally known that some ancient peoples used honey for embalming; and it is related that an inquisitive antiquary, on discovering a large jar or pot of honey in some ancient excavations, tasted it with his finger, and found a hair adhering to his tongue; and farther investigation revealed the fact that this was one of the coffins containing an embalmed body; and the honey therein, notwithstanding the use to which it had been put, had retained its flavour for many centuries.

A nest of wild-bees is still a lucky find among natives, and travellers do not disclaim to share the feast with them, whilst the stings of the despoiled owners do not trouble them, for they know that 'little smoke will stupefy the bees and make them harmless. The Hindus feed their new-born babes with honey and ghee for luck; and the custom, which once prevailed everywhere, of telling the hive-bees whenever a death occurred in the family of the owner, and of tying pieces of crape to the hive to put them in mourning, lest they should forsake those who had not treated them with proper respect, has not yet died out among our peasantry, and carries us back to the time when bees were among the most valuable possessions of the agriculturist, a fact still preserved in the proverb, 'A swarm of bees in May is worth a load of hay.' At that time, no one knew anything about Ligurian queens or the fertilisation of red clover; and had any one proposed to modify the proboscis of the bee or to breed a race of stingless bees, he would have been laughed at as a madman.

'What is sweeter than honey?' said the expounders of Samson's riddle, in answer to which modern chemists have put forth saccharine; but the intense sweetness of this chemical extract will never supersede sugar and honey, for the flavour is not agreeable to the palate of men; and even wasps and bees, fond as they are of sweet things, reject saccharine with disdainful fury, and will buzz angrily about anything sweetened

therewith without touching it, as though they felt themselves defrauded of their lawful perquisites, and were wroth with those who would try to deceive them.

• A MESSAGE FROM THE DESERT.

CHAPTER IV.—CONCLUSION.

ROBERT was scarcely surprised at the unwelcome appearance of his half-brother. He had all along suspected that he had overheard his conversation with his sister relative to the search for Jim Turner, and naturally would have kept a watch on his movements. He therefore accepted the situation without much comment; but as soon as he could get away without exciting suspicion, made his way to the telegraph office. Here he wired to Owen at Bendabar, giving him the clue of the rocky bar and all other details furnished by Turner. He asked him to follow the search up at once, and if successful, to keep the papers until his arrival, and restore the spot where they were found to its original state, as though it had been undisturbed. This done, he felt more at ease.

He knew that Alf would soon get all he wanted to know out of poor, simple Jim; and he was not at all sure that he did not intend to play him some trick on the way up and get ahead of him. The four hundred miles to the station were, however, negotiated without any mishap. He did not trust himself to exchange glances with Owen, lest Alf's sharp eyes should note it; but as soon as there was an opportunity, the manager told him that he had been quite successful. The papers were still in the tin, but Robert begged his friend to keep them where they were until the force of a search had been gone through.

Next morning, they started down the river; and Jim Turner soon identified the spot where they were camped when Burgess appeared. Needless to say, the search—extended into the next day—was fruitless. The general conclusion was that if Burgess had buried anything, it had been only just beneath the surface, and the tin was probably soon laid bare. In that case, the first bush-fire that swept over the spot would destroy the contents.

Alf did not seem at all elated at the fact that nothing had transpired; and Robert guessed that the state of uncertainty was worse to him than the discovery of the hidden tin would have been.

Jim Turner was rewarded; and Alf took his leave, Robert announcing his intention of spending a few days with his friend Owen. From something he noticed in Alf's manner, he mistrusted the fact that he had really left the station, and believed that his suspicions had been aroused by the non-discovery of anything, and that he was still keeping a watch on his movements. So impressed was he with this idea, that it was not until he retired and locked himself in his bedroom that he commenced his investigations. The tin had preserved its contents with wonderful fidelity. On lifting the lid, the papers appeared to be in almost as good a state of preservation as when first placed there. There were three folded papers and a small note-book.

He opened the folded papers. They were all in his brother Sam's writing, in pencil, and, by a strange coincidence, he read them in their proper sequence. The first was addressed to himself, and ran: 'DEAR BOB—We have had bad luck, and worst of all, I have met with an accident that has crippled me. I am just scribbling this to say good-bye in case things take a turn for the bad. If I don't turn up again, you know how to act for the good of all at home.' Then followed some affectionate messages to his mother and sisters.

The second paper bore date the next day, and was but a few lines: 'Burgess has come back. I am much worse, in awful pain; shall never leave here. Thank God, I am not deserted by everybody.'

The third and last was almost illegible; the reader managed to decipher: 'Burgess will tell—too bad—I had forgiven—now left here—die.' The rest was unintelligible.

Robert dropped the message from the dead man whose bones lay in the desert. His half-brother's name was not mentioned; but he read the whole story as though it had been printed. Sam had met with an accident, and Alf had left him to get on as best he could. But what was the accident? and how did he meet with it? The note-book would tell him that.

He took it up and opened it. Just then all the dogs on the station commenced to bark furiously, as though some one was coming. He opened his window and looked out; but all seemed quiet; and after a fight among themselves, the dogs subsided into silence.

He commenced the note-book, wherein Burgess had, as he said, told the true story of Sam's death.

'I promised Sam Patten when he was dying that I would tell the truth; and I swore to Alf, after he saved my life from the blacks, that I would not. I will write it all down; hide it, and never speak of it again. I don't know what to do. From the start, Alf Patten made himself disagreeable; and although Sam stood it very quietly for some time, at last he quarrelled with him; and after that, there was nothing but rows between them. The morning we found five of the horses poisoned, they had the worst quarrel. Alf was away, when we camped the night before, and he blamed his brother for not noticing the poison-plant about. While they were still at it, the black boy and I started after two of the horses that had strayed away. While we were tracking them up, we both thought we heard a pistol-shot in the direction of the camp. When we got back with the horses, we found that there had been an accident. Sam, while doing something to his revolver, had accidentally touched the trigger and shot himself through the hand. That was the story they told us. It was a clean wound; and I did not think it would turn out bad. We had good country and easy travelling for a day or two, and Sam's hand seemed getting on very well; then we had a long dry stage and hot weather. Sam's hand took a sudden turn for the worse, and when we got to some good water and grass, he said he could go no farther, but must stay there until his hand was easier. Ever since that morning, the brothers had not spoken, and Sam would not let his brother help him in

any way. We spent three days at the water-hole; and the rest and plenty of cold-water bandages did the wound good. Alf had been getting very impatient, and at last he said that we had come nearly as far as we wanted to, and seen most of the country they had come to look at; that the best thing to do was for Sam to stop at the camp, while we went on about fifty miles farther, and then we could go home by easy stages. This meant that we should be away from Sam for nearly three days; and I would not agree to it. But Sam himself persuaded me; he was anxious to get home, and thought that by the time we got back he would be able to ride, and there would be nothing to detain us. We started the next morning. While we were packing and saddling the horses, Alf went up and spoke to his brother. Whatever it was he said, the quarrel broke out again at once; and when we started, Alf had gone back to one of his fiendish tempers. We went about thirty miles that day, and camped. The next morning, as we were starting, I asked Patten how far we were going before turning back. He said: "Right on to the Overland Telegraph Line." I pulled up, and said I would go no farther, but would return to the camp. He argued with me that Sam was all right, and even tried to threaten me; but I rode away, and he and the black boy went on.

'I got back to camp that evening, and found Sam very bad. I think the excitement of the quarrel with his brother had inflamed the wound again. Next morning he was in terrible agony, and his arm was swollen right up to the shoulder. He was delirious, and kept praying me to cut his arm off. I never left his side except to get water to keep the bandages wet. The next afternoon he suddenly fell asleep, but woke up just at sundown. He was quite sensible, and had no pain at all; only, he said, "he felt too weak to move." He talked to me quietly about going back, thinking, now the pain had left him, he would be strong enough to ride in the morning. He told me that his wound was not an accident, but that his brother in a fit of passion had threatened him with his revolver; that he had tried to take it from him, and in the struggle it had gone off and shot him through the hand. He never meant to say anything about it, but for his brother going away and leaving him; and asked me to tell the true story if anything happened to him, and I promised. Presently, he said to me: "This is heavenly to be free from that terrible pain; I shall sleep so soundly to-night, old man." He never spoke again. I scarcely know when he died, but I think it was about an hour afterwards.

'Next morning, I was digging a grave as best I could, when Alf and the black boy came up. They had been riding all night. He was like a madman when he saw Sam's body, called himself a murderer, and vowed that he would go back and give himself up to be hanged. After Sam was buried, this fit seemed to wear off; and next morning we started home. We scarcely ever spoke during the next few days. Once he asked me what story I was going to tell when we got in, and I said, "The true one." A week after Sam's death we got to the Herbert River, and camped near a water-hole. Suddenly the place seemed alive with blacks, and a shower of spears

and "nullas" fell around us. The black boy was speared clean through the body; but I only got a crack with a nulla. I used my revolver, and made a rush for a carbine that was lying where I had been sleeping; but before I got there, I was knocked down, and the niggers rushed in and got hold of me. Another moment, and my brains would have been beaten out; but just then Alf came to my relief, and saved me. The black boy was dead. That night, when we were talking it over, Alf said: "I think I saved your life to-day, Burgess. Poor Sam is dead and gone, and it will do no good raking up our quarrel; cannot you hold your tongue when you get in?" Of course he had saved my life, and I scarcely knew what to say. "How shall we account for Sam's death?" I said at last. "He was killed here by the blacks," he replied, pointing back to where the fight had been. So it fell out that I agreed. He swore that he intended to go away and change his name, rather than face going home; and I promised to tell the story we made up that night. Next morning, we parted. He took three horses and most of the rations, as he intended to make for the Overland Telegraph Line; and I took the two worst horses, to try and get in to the nearest station. They died on the road, and I have walked in. I do not know whether I have done right or wrong; but this is the truth. With this book I bury three letters that Sam wrote and gave to me. Alf knows nothing of them.'

It was all out now; and Robert knew that every word was plain truth. He could see his half-brother in every line of the confession—the outbreaks of uncontrollable temper followed by fits of short-lived remorse. Doubtless, when he parted from Burgess he fully intended to keep his vow, and be henceforth a dead man to those who had known him. But time had blunted his feelings of regret; his character had degenerated; he had grown tired of his self-imposed exile, and the death of Burgess had been too great a temptation to return, removing as it did the only witness to his crime; for although no laws could touch him, he was as guilty of his half-brother's death as if he had shot him through the head.

What was he to do? He looked up, and started; there, pressed close against the glass of the window, was the face of his half-brother. The expression on it arrested Robert in the act of rising. He scarcely knew whether he was gazing at a living face or a dead one, it wore such a ghastly look. While he was hesitating, it vanished. Robert went to the window, which was an ordinary French light, opening on to the veranda, unlocked it, and was about stepping out, when he paused. A meeting between them just then had better be avoided; evidently, Alf's uneasy conscience had dragged him back; he knew now that Robert knew the truth, and he could do no more harm. He stood at the door and listened. There was a sudden outbreak from the dogs; then he heard the sound of a horse cantering down the paddock. The nocturnal visitor was gone. But Robert's way was no clearer; and he passed a wretched sleepless night.

On the third day, a man rode up to the station with a note for Robert. It was from Alf, and ran thus: 'Whatever Burgess wrote is true. I

know you found the papers, and have read them. I am going a long way out West, and this time I shall not return.—Good-bye.'

The writing was so unlike Alf's hard firm hand, that Robert instinctively asked the man, who was the hostler at a small public-house some thirty miles away, whether his brother had been drinking heavily.

'He went it pretty hot for a couple of days,' returned the man; 'but he seemed all right when he started this morning.'

'He had gone, then?'

'Yes; started the same time that I did. He said he was going to Barr Downs to-night;' naming a station to the westward.

Robert pondered over the communication. Was it reality this time, and did it point to a suicide's expiation?

He determined to follow. Turner was still on the station, having taken a place as boundary-rider, so he engaged him to accompany him; and Owen provided him with a black boy, a good tracker; for there was no knowing how far he might have to go. By the time he was ready, Alf had three days' start of him.

It was easy enough to follow him, for he was making due west from station to station, and travellers were not very common as they got into the sparsely settled outside district. He could not gain on him, however; at every station where he stopped the night, Alf had always left just the three days before. The last place they crossed, the Herbert, Robert thought he recognised the water-hole where the blacks had attacked Burgess; but all tokens of the fierce fight had long been dispersed by successive floods.

At last they came to the most outside station, within about fifty miles of the Queensland border. Beyond was still unsettled country for about three hundred miles to the Overland Telegraph Line. Alf had stayed the night at this place, and next morning he had gone on by himself, leaving the people on the place in some perplexity as to where he was bound to. From thence out Robert knew they would have to follow his tracks. Once in the unoccupied country, this was comparatively easy, and they went on the first day without a check. Robert knew as well as if Alf had told him that their destination was Sam's lonely grave; would he get there too late?

They camped the first night at a small hole of water at the head of a rocky creek. Next morning, still following the tracks of the two horses, they crossed a low range and emerged on to a wide plain. By night they found themselves on a small clay flat with tired and thirsty horses. They had water for themselves in their canvas bags; but unless there was some ahead, their horses would not last through another day of such fatiguing travelling.

Alf had, however, camped on the flat, so it was evident that he was making for some place ahead that he knew of.

On again the next morning. Straight across the plain went the tracks, and with jaded horses, the party followed them. When within about a mile of the creek, the black boy, who was ahead tracking, pulled up and pointed to the trees. Half-a-dozen kites were circling slowly in the

air over a particular spot, looking like black specks in the distance. 'There's water there,' said Turner. Robert did not answer, but motioned to the boy, and they pressed on. In a short time they rode up to the bank of the creek, in the bed of which was a shallow pool of water. The loose horses ran down and commenced greedily drinking; two others, who were feeding on the edge of the water-hole, greeted them with loud whinnies. A glance told Robert he was too late. He motioned to Turner and the boy to go on to the water, and dismounting, tied the reins to his stirrup iron, and let his thirsty horse go loose after the rest.

A man was lying at the foot of a coolibah tree. He might have been asleep; but people as a rule do not sleep in the noontide glare of a tropical sun. It was his brother, dead by his own hand. On the tree, at the foot of which he lay, a sheet of bark had been stripped off years before, and on the surface of the wood beneath, the initials S. P. had been rudely cut. Robert at once divined that the letters had been carved by Burgess, and beneath was Sam's grave.

They buried the lifeless form that had once held such fierce conflicting passions, by the side of the man whose death lay at his door; and in the grave Robert placed the written testimonies of the expiated guilt. The Message that had come from the Desert was left to moulder there; no man now would ever know it. Alf himself had solved for Robert the question of what he should do with the knowledge bequeathed him by the dead.

Next morning, with a saddened heart, the only surviving brother retraced his steps through the untrodden waste that surrounded the two graves. In after-years, when wife and children were his, and prosperity and contentment, his thoughts would often be recalled by a chance word to that time; and like a picture would rise clearly before him the scene he saw as he turned in his saddle for a last look. The gaunt and desolate plain; the creek, bordered with dwarfed, distorted timber; the soaring, tireless kites; the fierce sun overhead, beating down on the graves of his brothers beneath the stunted, shadeless, coolibah tree.

THE MONTH:

SCIENCE AND ARTS.

ONE of the most interesting matters brought forward at the recent meeting of the British Association was a demonstration of the isolation of fluorine. Six years ago this element was isolated in France; but the results had not been confirmed in this country. The apparatus required for the demonstration is furnished with platinum electrodes, through which a current is passed into a compound containing the fluorine. As a result, hydrogen is given off at one electrode; and fluorine, in the form of an almost colourless gas, at the other. The action of fluorine upon various substances is remarkable—silicon, boron, sulphur, and various metals igniting and burning brilliantly directly they come within its reach.

Those who have been led to hope that a balloon will represent the flying machine of the future have usually pinned their faith upon a screw propeller as the best means of urging it through the air. Some experiments in this direction have recently been made by M. Mallett, the results of which have been presented to the French Academy. With a screw having a diameter of seven and a half feet, and with a velocity of one hundred revolutions per minute, this experimenter succeeded in raising the balloon three hundred and thirty-three feet high in the same time—that is, one minute. Repetitions of the experiment invariably gave the same results. Unfortunately, no particulars are given of the kind of motor used in accomplishing this astonishing result.

The phenomenon known as 'bleeding bread' has, according to a correspondent of *Nature*, made its appearance in this country during the recent hot weather. It is an organism which appears on bread, boiled potatoes, rice puddings, and other farinaceous compounds, in the form of red stains, which resemble splashes of blood. It was first noticed in this country in the year 1853, when an account of it was communicated to the British Microscopical Society. It is only seen during periods of high temperature, and is sufficiently rare to give rise to superstitious notions, which, in spite of Board schools, are still rife enough in country districts.

At the Congress of photographers recently held in London, the most interesting item was a demonstration of M. Lippman's method of producing photographs in colour. Some months ago, specimens of this process were shown in Paris; but the method of exhibiting them has been since improved by M. Lumiere. The colours are due to what is known as *interference phenomena*, and are produced in the photographic film in the following manner: a specially prepared gelatine plate, bearing an almost transparent film, is placed with its sensitive surface in contact with a tank of mercury, and exposure to light-action through a lens is made through the back of the plate. The projected rays of light meeting the reflected rays from the brilliant quicksilver give rise to interference colours in the resulting photograph. Such colours can only be seen on the film when the plate is held at a certain angle, and they resemble and are analogous to the iridescent tints on mother-of-pearl. Viewed in this way they are ineffective; but when placed, according to M. Lumiere's suggestion, in the beam of a powerful electric arc light, and a reflection from the coloured surface is thrown upon a screen by the aid of a lens, the result is very brilliant. The experiment is a most interesting one, the colours produced approximating to those of nature.

Another very different method by which photographs are associated with colour is now to some extent superseding the old chromo-lithographic process. The method is strictly mechanical, and has nothing whatever to do with the solution of the colour-photography problem. Three printing blocks are made by the Meisenbach half-tone process, by which the original photograph is cut up into printable lines and dots. But each block is made from a negative, which takes cognisance of only one colour in the original design—red, yellow, or blue, the so-called 'primary' colours of

the old text-books. This is brought about by using in conjunction with the camera differently coloured screens, which will only admit rays of one colour to pass to the sensitive surface within. Each of these blocks is printed from in turn with its own coloured ink, the three images being superposed upon one another, and the general effect produced is that of a chromo-lithograph printed from a number of stones. The specimens which we have seen are exceedingly satisfactory; but it remains to be seen if equally good work can be turned out in bulk.

Another matter of photographic interest is the establishment in London of the first of a series of annual Exhibitions under the title of the 'Photographic Salon.' The object of the promoters is to exhibit the artistic capabilities of photography, putting its scientific and commercial aspects entirely aside. The pictures hung are about three hundred in number, and have been selected for their artistic merit. They are quite a revelation to those whose standard of photographic excellence is borrowed from ordinary sources. Both portraiture and landscape are presented here with an artistic and, in many cases, a poetic feeling which most persons would think quite unattainable with a camera. The Exhibition is unique, and it has attained a deserved success. All will look forward to the reopening of the Photographic Salon in the autumn of 1894.

According to a paper recently brought before the Association of Belgian Chemists, certain continental bakers mix soap with their dough, in order, it is said, to make their bread and pastry light. The soap is dissolved in water, and to this a little oil is added, the mixture being subsequently whipped into an emulsion, which is added to the flour. The idea of soap as an edible substance is not a pleasant one, but possibly the bakers referred to are particular to obtain a pure kind. Genuine oleate of soda, which is made by combining caustic soda with vegetable oil, would not be altogether objectionable; but we should be inclined to prefer home-made bread of the old-fashioned unsophisticated kind.

We are informed by a correspondent that some time ago the Geneva Library became possessed of a collection of unopened Egyptian papyri, which on being carefully manipulated and examined by M. Nicole, were found to be of great interest and value. They include a fragment of the *Orestes* of Euripides, which is believed to be at least one thousand years older than any other manuscript of the same work at present known. There are also portions of the *Iliad*, containing great variations from the usually accepted text. The collection also contains an Idyll on Jupiter and Leda, and an Elegy on the Stars. A curious document is a letter from the head of a monastery requesting the use for three months of certain horses. The animals were to aid the monks in getting about the country; and as an inducement for granting the request it is urged by the borrowers that 'they are orthodox.' There are other interesting items in this valuable collection of papyri.

It will be remembered by many that the late Mr Richard A. Proctor, who did perhaps more than any other writer to popularise the science of astronomy, died five years ago in New York

city of yellow fever, which disease he contracted in Florida. His grave remained neglected until a newspaper urged the claims of the deceased writer upon its readers. The response was quick; and a handsome monument has been erected to the astronomer's memory, adorned by a noble inscription, the work of his great friend, Herbert Spencer. There are many in this country who, without personal knowledge of Mr Proctor, have read his books or attended his lectures, and these will be glad to know that his memory is preserved in this manner by our English-speaking cousins across the sea.

The 'telegraph' which is placed on all steamships for communicating the captain's orders to the engine-room by means of a bell, dial, and pointer, is now, we understand, being adopted for street vehicles, so as to avoid the necessity of the occupant leaning out of the window and giving verbal directions to his driver. The new device consists of duplicate dials and pointers with such directions as 'Stop,' 'Go on,' 'Turn to the Right,' and so on, one being within the vehicle and one outside, both working synchronously.

Another comfort for travellers is the provision of reading lamps on the penny-in-the-slot principle, which are presently to be placed on some of our railways. On the District Railway, London, two thousand five hundred lamps will be required, and the carriages are being now wired for their reception. The lamps are electric, and the act of dropping in a penny will set a clock in motion for half an hour, during which time the current will be switched on to the lamp, and will concentrate a light of twenty candle-power upon the newspaper or book of the passenger who expends the coin.

Mr G. J. Symons, F.R.S., to whom the public is much indebted for his constant meteorological observations, has lately made some references to the rainfall during 1893, which will interest many. We all know that the year has been a remarkably dry one, and unless its closing weeks should bring with them tempests and floods, it will probably prove to be the driest on record. For thirty-five years Mr Symons has made constant observations of rainfall and other weather phenomena, and he tells us that only once has he previously registered the rainfall of four consecutive months at less than an inch each, and then it was winter-time and at the end of two exceptionally rainy years. For more than thirty years no year has been so dry as the seven months ending October last, and this applies both to London and the country generally.

It has been announced that the Manchester Ship Canal will be formally opened throughout its entire length on the first day of the new year, when ships will be able to find their way from the Mersey to the Manchester Docks. Every one will wish this bold and costly enterprise the success which it undoubtedly deserves.

We have more than once alluded to the value of finger-prints as a means of identification, and our readers will possibly be interested in knowing that the system has been adopted in the Indian army. The Order issued by the authorities is as follows: 'It is requested that as a means of identification of recruits for the native army, examining medical officers will cause an impres-

sion in printer's ink of the ends of the first three fingers of the right hand of each recruit passed by them as fit for the service to be made on the Nominal Roll opposite the name of the recruit; and in the case of the Army Hospital Corps, on the Verification Roll.' This innovation is mainly due to the exertions of Mr Francis Galton, who, it will be remembered, read a paper on the subject of 'Identification by Finger-marks' at the recent meeting of the British Association at Nottingham.

An incandescent arc lamp—by which is meant the combination in the lamp of the main features of the electric arc and the glow lamp—was described at the recent Electrical Congress at Chicago. The two carbons between which the arc is formed, which must be of very fine quality, are enclosed in a glass globe which is highly refractory. At the top and bottom this globe is closed with plugs, through which the carbons pass; and there is a safety-valve provided, which prevents any undue pressure upon the internal walls of the vessel. When the arc is once established, the enclosed oxygen is consumed; and the remaining gas mixed with carbon vapour becomes so luminous that the arc itself is almost invisible. Economy is claimed for this system both in the amount of current required, and in the saving of carbon rods, which consume less rapidly than if they were exposed to the air.

Some months ago we described how the buildings of the World's Fair at Chicago were being painted without brushes by means of a gigantic spray apparatus. A somewhat similar plan, it is said, has been adopted for the application of whitewash to ceilings. First of all, the whitewash is very carefully screened or filtered into a barrel, to which is attached the suction-pipe of a double-acting force-pump. With a pressure of one hundred pounds on the square inch, the mixture was pumped into the delivery tube, and discharged through a hole not more than one-sixteenth of an inch in diameter. The whitewash is thus sent aloft in a very finely divided form, ladders, scaffolding, and extra labourers being dispensed with, while a saving of expense all round is secured.

Our contemporary, *Knowledge*, calls attention to the peculiar eye-trouble common among hop-pickers which goes by the name of 'hop-pickers' ophthalmia.' It is ascribable to the microscopic hairs which cover the leaf of the hop, and which, it is thought, may possibly partake in a small degree of the properties of the nearly related stinging nettle.

The uses of steel are constantly increasing, and one of the most interesting of its applications is that of bell-casting. Hitherto, the bell-founder has relied upon bell-metal, which is an alloy of copper and tin; but cast-steel has recently been employed for the purpose, at a great saving of cost. It does not seem, however, that the tone of the new bells is quite equal to that of the old, and it is believed that some way of improving the steel for this purpose may be discovered.

The cycle is said to be threatened with a formidable rival in the shape of a pneumatic road skate, which will shortly be placed upon the market by a Scotch firm. The new skate, instead of having four wheels, like the ordinary roller

skate, has only two, which are placed in line one behind the other, and are not solid, but furnished with pneumatic tires. With this aid to locomotion, it is said that ordinary roads can be traversed with ease, and that the ascent and descent of hills are by no means difficult. The skates have been already seen in some of the Midland towns, where a speed of from six to seven miles an hour has been attained with them in the ordinary thoroughfares. Simple pedestrianism, it would seem, may soon go out of fashion.

A machine for typewriting musical characters has recently been invented and exhibited by Mr F. H. Bowen of Springfield, U.S.A. In outward appearance it looks like the ordinary Remington typewriter, and can, it is said, be as easily manipulated. It will impress the notes, &c., on paper already ruled with the five lines of the musical stave, or will print the lines itself as the work proceeds. The machine should be of use to those who find a difficulty in writing music legibly, and we fear that there are many musicians who labour under this disadvantage.

Many are the serious accidents which have occurred from bottles bursting or breaking while being uncorked or unstopped, and this has been especially the case since mineral waters have been bottled in receptacles which require heavy pressure to release the marbles or other devices by which they are closed. A Safety Bottle-opener, which has been devised by Mr W. Fletcher of Denby, near Derby, is, therefore, an opportune and valuable invention. It consists of a kind of semi-canister, which fits over the neck and shoulders of the bottle, containing at its apex a movable stopper, which can be pressed down while the hand is protected by the canister-like casing.

It is well known that the maintenance of large areas of glass on high buildings gives rise to constant trouble and expense, and we fancy that the yearly bill for repairs at such a building as the Crystal Palace, Sydenham, must be of enormous proportions. Breakage, as well as the evident danger to people beneath, will be obviated by a new device which is said to be practicable, and not costly. The glass during manufacture is moulded upon steel-wire netting, so that it is furnished with a strong skeleton, so to speak. The new material can during manufacture be bent without much difficulty, and it is obvious that it can be used in much larger squares than ordinary glass. A somewhat similar material, consisting of a transparent varnish which filled up the interstices in wire-work, was brought forward some time ago, but it intercepted much light, and was inflammable in its nature.

The experience of the past summer, when wasps were unusually and most unpleasantly plentiful, has shown that some persons are peculiarly susceptible to the poisonous sting of these insects. A case was recently reported in the *Lancet*, where a man, fifty-six years of age, was stung by a wasp on the middle finger of the left hand. He was admitted to a hospital, for he had become faint, and pains extended up his arm and all over his body. Severe rigor followed, accompanied by sickness and other distressing symptoms. The pulse became very feeble, and the temperature rose above the

normal. The man ultimately recovered ; but the case shows that a wasp must be avoided by certain individuals as most persons would avoid a poisonous snake.

A SOUTH ATLANTIC MYSTERY.

THE 'Enterprise,' outward bound to New Zealand, was rippling through the deep blue waters of the South Atlantic Ocean, with a light breeze from the south-west, which kept her moving at the rate of four knots an hour. Here and there the dancing waves were crested with a dash of creamy froth ; and a long streak of gray light was showing itself amidst the clouds in the distant east, as the dusky night slowly and reluctantly gave place to dawn. Presently, an old quartermaster lurched sleepily along the deck and peered down the companion hatch at the cabin timepiece. Finding that it was four o'clock, he returned forward with a livelier step and struck eight bells. The clear chimes echoed in the keen frosty air with a silver-like intonation ; the shrill notes of the boatswain's whistle were heard rousing up the men of the port watch ; the hands came aft to muster ; lookout and helmsman were relieved ; the starboard watch went below ; and then the decks became again deserted, as though the momentary bustle and life and movement were but caused by the magic wave of an enchanter's wand. In a few minutes the only audible sounds were the occasional rattling of the wheel-chains, and the mournful creaking of the yards as the vessel swayed gently to the long heave of the Atlantic billows.

In the meantime the chief-officer had made his appearance on deck, and was standing with the second at the break of the poop. After receiving the usual information about the course, the number of sails set, &c., and commenting upon the state of the weather, he suddenly started a conversation, the subject of which had evidently been in the thoughts of both of them before.

'I can't understand it,' he said. 'Here are we in the fifty-fourth degree of south latitude, and the skipper is still making a southerly course. We shall be down amongst the ice soon. I shall give him a hint about it when he takes sights after breakfast.'

The second-mate looked cautiously around, as though to make sure that no one else was within hearing, and leaning close over to the chief-officer, said in a low voice : 'Have you noticed anything strange about the captain's manner lately, Mr Wilson ? He was always quiet and standoffish like ; but during the last few days he has spoken and acted at times in such a strange way that I have sometimes fancied he was—a little'—Here the second mate touched his forehead significantly.

'Well,' replied the mate, after a pause, 'I don't mind admitting that I have noticed it for some weeks past ; but I thought it best to keep quiet, in case I was mistaken.—But don't breathe a

word to a soul, for those fits of abstraction may only be a peculiarity of his, after all.'

'But the strange look in his eyes'—insisted the second-mate.

'Mr Martin, we must not jump to hasty conclusions,' returned the chief. 'What I want first of all to find out is—why are we steering so far to the southward ?'

'I hope he'll give a satisfactory reason,' replied Martin as he turned to go below ; 'for I've made nine voyages to the colonies, and was never so far south before.'

At seven o'clock the captain came on deck, and after exchanging a few words with the chief-officer, walked to the starboard side and looked long and earnestly towards the southern point of the horizon. He was a tall, fine-looking man, with a sunburnt and rather handsome face, a square, resolute-looking jaw, and long iron-gray hair, a lock of which, in moments of excitement, he had a curious habit of twisting round his fingers. But the eyes, which were of a steely gray and very piercing, were the distinctive feature of his face, principally on account of the singular expression which dwelt in them. It is hard to describe it—a sort of restless, eager look, as though for ever on the watch for some one or something that he had been long expecting to meet. His age, according to the ship's articles, was thirty-six, though he looked eight or ten years older ; and although usually of a somewhat reserved disposition, speaking little to his officers except on matters of duty, yet at times, when he 'came out of his shell,' as the second-mate expressed it, he could be a most agreeable companion, as he was fairly well read, and had visited many queer, out-of-the-way places in the remote corners of the earth. Professionally, he was as capable and gallant a seaman as ever trod a deck.

Having apparently satisfied himself that nothing was in sight, he took a few impatient turns up and down the quarter-deck, and then crossed over to where the chief-officer was standing.

'Mr Wilson,' he said, speaking very slowly, and regarding his chief-officer with a strange, steadfast look, 'I have something to tell you which will explain my reasons for taking a much more southerly course than is usual with outward-bound vessels. I was thinking the matter over last night, and then decided to take you into my confidence.'

There was something in Captain Roberts' manner and in the expression of his eyes that startled the chief-officer, and yet for the life of him he could not have told why. However, he said nothing, but inwardly wondering what it was the captain had to tell him, waited for him to proceed.

'It was in the year 1875, ten years ago now,' he began, 'that I was in command of a small steamer on the Australian coast. I had taken her out from England when she was new, and at the request of the owners, remained in her after our arrival at Adelaide. I had left my wife behind me in London ; but as, after a time I decided to make my home out in the colonies, I sent for her to join me. She sailed from

Liverpool in a barque called the "Lord Clive," on the 10th of December 1875; that vessel never arrived at her destination—only once, from that day to this, has she ever been heard of.' Here the captain paused, and stood for a few minutes gazing out to sea, as though lost in thought.

'Was the "Lord Clive" lost, sir?' the chief-officer ventured to inquire, finding the skipper still remained silent.

'They say so,' he replied. 'The last time she was seen, or at least spoken with, was by a whaler, in latitude fifty-four degrees south, and longitude ten degrees east, somewhere near the supposed position of the Bouvet Islands; though, what she was doing there, I can't imagine, unless she had been driven out of her course by a succession of northerly gales. That was nine years and a half ago, and she has never been heard of since. The owners, underwriters, indeed everybody I have spoken with on the subject, seem convinced that she is lost; in fact, the captain's wife has married again; but I believe the "Lord Clive" is still afloat, and that my wife is on board of her—alive!'

The chief-mate started, and stared at his commander with astonishment, not unmingled with a slight feeling of alarm, for whatever doubts he may have previously had on the subject of the captain's sanity, it now became evident to him that on one subject at least he was mad. To suppose that a ship which had not been heard of for nine and a half years was still afloat, and people alive on board of her, struck the practical chief-officer as out of the bounds of reason.

'I went home to England,' continued Captain Roberts, and the tone of his voice showed that he was labouring under suppressed excitement, 'and interviewed the owners of the "Lord Clive," offering to take command of a ship without pay, if they would place one at my disposal, and go in search of her. But they would not listen to me, for by that time the insurance had been paid, and they took no further interest in the vessel's fate. I have made eight voyages out to the colonies since then—for I will never trade anywhere else, and I can't get command of a whaler—and every time, I go a long way to the southward in the hope of meeting the "Lord Clive," for I expect she got down amongst the ice and was frozen in. But some day she'll break away and drift out into the open sea again; and I should like to be the first to board that ship, to meet my wife, and welcome her back to the world once more. For she is not dead, sir, I tell you, Mr Wilson—with an impatient stamp of his foot and a wild gleam in his eye—'she can't be dead; we only parted for a time—only for a time—and I feel as sure as I am standing here, that we shall meet again.'

'But not in this world,' muttered the chief-officer under his breath.

The captain turned to walk aft, but his steps were arrested by a shout from a man who was about some job on the main yard: 'Sail ho!'

'Where away?' roared the mate from the break of the poop.

'Broad on the starboard bow, sir,' replied the man.

The captain seized his glass from the companion hatch and hurried to the weather mizzen rigging, followed by Mr Wilson. On the utmost verge

of the horizon, where the gray-blue waters seemed to finish in a sharp clear-cut line against the paler sky, a small dash of white, barely the size of a sea-gull's wing, was visible. For the space of three minutes the captain gazed at it, then, closing his telescope with a snap, he took a few hurried paces on the deck. After a few moments of this restless kind of walk, he again pointed his telescope at the strange sail. 'We're rising her; don't you think so, Mr Wilson?' he exclaimed.

'It is scarcely possible to tell yet, sir,' replied Wilson, 'she has been in sight so short a time.'

'I am going below to examine the chart,' continued the captain; and despite the assumed calmness of his tone, it was evident that he was strongly excited. 'Keep her up a couple of points; we must overhaul yonder craft, for I want to speak her, and—if I am not on deck before—let me know when you can make out her hull.'

Two hours passed, and the 'Enterprise,' slipping smoothly and cleverly through the water, closed up to within three miles of the strange ship, which appeared to be drifting helplessly upon the ocean. She had only one rag of a sail, which fluttered heavily in the breeze, and her mizzen-mast and foretopmast were gone. As they drew still nearer, the chief officer was struck with the strange, dismantled appearance of her spars and rigging. Captain Roberts came on deck and looked thirstily at her through his telescope.

'Clear away the cutter!' he shouted, and the clear, sharp, intonation of his voice seemed to fetch an echo from the hollows of the sails.

The men came aft in obedience to the order, and as the second-mate went to see to the execution of it, he was stopped by the captain, who said: 'I shall want you in the boat with me, Mr Martin, and three picked men.'

'Very good, sir.'

The vessels were now within half a mile of each other, and the order was given to 'heave to!' The wind had died away to a light air with almost startling suddenness, but the horizon to the north-west was blurred and indistinct with a sort of gray, smoke-like haze.

While the boat was getting ready, the captain was pacing the deck with restless and feverish impatience, at times pausing in his hurried perambulation to gaze at the other vessel with an eager, longing look, as though on board of her he could see the form of some dearly loved person whom he had long been parted from. Presently he stepped up to the chief-officer, and touching him on the shoulder, pointed to the strange vessel, and in a voice trembling with excitement, said: 'Just look through your glass, Wilson, and see if you can make out anybody on her quarter-deck—a woman.'

'I can see nobody; the ship is evidently deserted,' the chief replied as he handed the telescope to the captain.

'Deserted! Man, are you blind? Can't you see the flutter of a woman's dress?' he cried, with fierce impatience. Then stretching out his arm, and pointing towards the drifting vessel: 'That ship is the "Lord Clive;" and my wife, I have every reason to believe, is there, sir. I saw her figure but this minute, and I should know

her even at this distance.—Yes, I have found her at last—I have found her at last !'

Wilson's honest sunburnt face wore an expression of the utmost astonishment and pity, and he was about to make some sort of a reply, when the second-mate came aft and reported the boat as ready.

Captain Roberts without another word entered it and took his seat in the stern-sheets ; but the chief-officer managed to convey a hint of the skipper's mad fancy to the second before the boat shoved off. 'Look well after him,' he whispered ; 'for God knows what he will do when he finds no one on board that ship, as I feel confident will be the case.'

As they approached her, Martin observed that her hull was terribly weather-beaten—some shreds of sails hung from her topsail yards, and ragged ends of rigging and running gear hung over her side. There was ice, too, about her, although the thermometer was scarcely down to freezing-point, a pretty conclusive proof that she had but recently drifted up from the desolate frozen seas that encircle the South Pole. The captain occasionally muttered something to himself ; his face was flushed, as though with some pleasurable anticipation, and his bright eyes burned with a wild light, but all the time he kept his gaze fixed upon the after-part of the dismantled barque.

Presently the boat swept under her counter ; the name which had been painted on her stern was partially obliterated ; but Martin's heart gave a big thump when he saw that the letters which remained—evidently the final ones, were—'IVE.' Was it the 'Lord Clive,' after all ?

'In bow ! Way enough !' he roared. They were alongside !

The captain swung himself lightly into the main chains, then climbed over the rail on to the deck. The second-officer was about to follow him, but the skipper waved him back. 'Wait until I call for you, Mr Martin,' he said ; and then he disappeared. For about twenty minutes the boat's crew held alongside, but the captain made no sign, although at times they fancied they could hear him moving about the decks. Suddenly they were startled by a loud cry, which seemed to come from the cabin. Sharp and shrill it rang upon the air, with a note of grief and agony in the ghastly sound of it, such as might have been the last cry of a lost soul. Sailors are usually superstitious, and that awful scream, coming as it did from the heart, as it were, of that mysterious vessel, caused the sunburnt faces of the boat's crew to blanch with fear. Even the second-mate, who was a hard-headed practical man, felt an eerie feeling creeping over him, and it was some few minutes before he could muster up courage to leave the boat and try to find out the cause of that awe-inspiring cry ; but after a short hesitation, he clambered up the side.

There was no sign of a living soul upon her decks, which had been swept nearly bare by the seas. A piece of canvas fluttered from the stump of the mizzen-mast, and it was probably that which Captain Roberts' mad fancy had transformed into a woman's dress, when he saw it from the deck of the 'Enterprise.' He had evidently gone down below ; and Martin, as he stood by the

companion hatch of the deserted ship, had an inward feeling that he was about to assist at some weird tragedy.

Before going below, Martin took a look round the horizon, and what he saw there caused him more real apprehension than any of the undefined terrors of the mysterious ship. Away to the north-west the horizon was blotted out by a gray smother of vapour, which was rapidly spreading itself in all directions. There was considerably more weight in the swell, too, and the wind gave out a hollow moaning sound as it swept through the rigging. Martin rushed to the taffrail and shouted : 'Come on board here, one hand !'

In answer to his call, one of the men scrambled up on deck.

'Keep a lookout while I go below and search for the captain ; and let me know before that smother gets too close on top of us,' pointing to the white mist that was steadily coming down on them.

'Ay, ay, sir !'

On descending the companion stairs, the second-mate found himself in a moderately sized saloon with sleeping cabins on either side, and some lockers aft by the stern ports. There was a table in the centre, and a skylight overhead which admitted enough light to enable him to see clearly. A small hatch was open on the star-board side aft, apparently leading to a sort of lazarette. By the side of this hatch a dark figure was lying, face downwards. It was Captain Roberts ! Martin stooped down and lifted his arm, but it was limp and lifeless ; he then turned him over and endeavoured to raise him to a sitting posture, but with a shudder he let him fall, for he was quite dead. What sudden shock had caused his death, cannot be told : out firmly grasped in his right hand he held a faded white shawl of some soft material, such as women wear over their shoulders, and his features were distorted by an expression of horror hard to be described. What had he seen ?

Fancying he heard a slight rustling sound in the lazarette, Martin peered down the small hatch, but it was so pitch dark that he could see nothing. Was there anything down there that might help to solve the mystery ? Just then the hoarse voice of the seaman was heard in a warning shout : 'Come on deck, Mr Martin, quick ! or we shall be adrift !'

The second-officer rushed up the companion ladder on to the quarter-deck and cast one sharp look to windward. There was a dense bank of fog not much more than a mile distant, and a dark shadow on the sea showed that wind accompanied it.

'Come and help me to lift the captain up on deck,' he cried to the man who had been keeping watch.

'Where is he, sir ?'

'In the cabin—lying there—dead !'

'Dead ? Then the living come first, sir,' replied the man gruffly as he ran towards the side. 'If we don't clear out of this now, we shall lose our ship, and be cast adrift in this cursed hulk.' With that he climbed over into the boat.

The second-mate hesitated for a moment, scarcely knowing what course to pursue, when the seaman yelled to him again, in a voice half

wild with impatience and fear: 'Jump into the boat, Mr Martin, or we'll *slove* off.'

The words had scarcely left his lips, when the wind, with a sort of mocking shriek, swept through the rigging of the derelict, and a few moments later the fog was swirling all round them. Martin sprang over the side into the boat, and the men commenced pulling madly in the direction where the 'Enterprise' had last been seen. For five minutes they pulled on with all their strength, the sweat pouring down their faces, then they eased up a bit, and the man who was at the after-oar asked the second-mate if he could make out their vessel.

Martin strained his eyes to pierce the surrounding gloom, but was obliged to acknowledge that he could see no sign of either ship.

'Then, sir, we're hopelessly adrift now, without a drain of water or a mouthful of food,' cried the man, with a ring of passionate despair in the tone of his voice.

'Keep cool, my lads, and pull steadily on; we shall fetch the old "Enterprise" right enough,' said Martin.

At that moment a dull boom was heard right ahead.

'There goes a gun from our ship to show us our whereabouts,' sang out the second-mate; 'give way, my lads!'

The men pulled with a will; and five minutes later the 'Enterprise' loomed up out of the fog close aboard of them. A line was thrown, the boat hauled alongside, and in a few minutes they were all standing safely on her decks.

Martin reported to the chief-officer everything that had occurred; but as the wind and sea were rising fast, and the driving mist obscured everything from view, the only thing that could be done was to heave the ship to until the weather cleared a bit. All night long it continued to blow hard; but about nine o'clock the next morning the wind fell light again, and the fog lifted a little, although it was still very thick all round the horizon, and it was not possible to see a greater distance than two miles. All hands were on deck, peering into the dim obscurity, to get a glimpse of the derelict in which lay the body of their unfortunate captain; but to no purpose. About two o'clock in the afternoon it came on to rain heavily, beating all the life out of the wind, while the gray sea rose and fell with long sullen heavings. The 'Enterprise' still remained 'hove to,' as it was quite useless attempting a search while the weather remained so thick. So it continued all the following night, until shortly after daybreak on the second morning, when the rain ceased, the clouds and mists drifted away, as the sun rose gaily above a clear horizon. The whole wide expanse of ocean was now visible, and sharp-sighted men were despatched to the masthead on the lookout; but no sign either of ship or wreckage rewarded their search. A light breeze sprung up from the south-west, and for four days they cruised about those waters; then the chief-officer reluctantly abandoned the search as a hopeless one, and the 'Enterprise' proceeded on her voyage to New Zealand.

There can be little room for doubt that the derelict barque foundered during the gale of wind on that eventful night; and if indeed she was the ill-fated 'Lord Clive,' which, after nine

long years of imprisonment in the ice, had at last broken loose and drifted into the ocean highway, then the strange meeting between those two ships was more than a mere coincidence.

The men who were in the boat to this day declare that it was a woman's voice which uttered that startling cry; but whether their statement is correct, and what it was Captain Roberts saw in the barque's deserted cabin that left that expression of horror on his face, are mysteries deep and unfathomable as the ocean where he lies at rest.

A VIGIL.

Is this the dawn that slowly leaves
The shadowy bed so still and white,
And with its cool, soft touch unweaves
The fevered fancies of the night?

Is this the dawn?—Oh! love, you lie
So calm beside the taper's beam,
As though it were not you and I
Who laughed together in my dream;

While o'er the flowery way abreast,
We stept along the springy lea,
Till outward to the closing west
Gold pathways led across the sea.

And all the purpling deeps of space,
And all eve's tender, softening shine
Were deeper, holier round your face,
Your face, my love, so close to mine.

And lo! your eyes looked o'er the bay
And shone so—two conflicting gleams,
Love's dawn, and the last glance of day
Met in a halo.—Love, it seems

Only a dream; your floating hair
Beam-billowed, and a dream your face,
Now morning takes us unaware,
And draws aside the shielding lace

Of night; and breathing early flowers,
Looks boldly on the placid lid,
And brightens all the unheeding showers
Of gold, wherein last night lay hid

Your hand upon my shoulder. Dear,
In thy long dream, sometimes, ere night,
Bend o'er me when the sky is clear,
And look against the western light!

HAUNTED HOXTON.

A 'REMOTE, unfriended, melancholy, slow' quarter of London is Hoxton, lying in the north-east between Old Street and Kingsland. To the majority of West End people but a geographical expression, about which they have, save for one thing, the haziest ideas—two only, in fact: one, that it is a place beloved by the 'coster' interest, and full of cabbage leaves; the other, that one of the finest theatres in London exists in it, the 'Britannia,' which, some thirty years ago, Charles Dickens, in his uncommercial travels, brought under the notice of readers in general. Thus much is known of Hoxton, and little more, save for the reason already mentioned, which is, that Mr Besant has laid one of the scenes of one of his most charming novels there, and has, with his usual accuracy, described the Hoxton of the present day in its habit as it lives.

What he has done we do not propose imperfectly to attempt, except to say that once a village lying outside London, it is now a densely crowded quarter, full of small industries, and tenement houses crammed with families, and much heart-rending squalor and poverty. Yet, passing down its main street, the eye constantly lights on fine old Jacobean and Georgian houses, red-tiled, dormer-windowed, with eaves and lofty attics; and once with ample gardens behind, now turned into yards, crammed with lumber, even as the stately houses have been subdivided into small shops, which represent all the needs of a densely populated, toiling neighbourhood.

Yet the Hoxton of to-day, fallen from its high estate, and weltering in mud and vegetable refuse, resonant with the bellowing of street vendors and the shrill chatter of innumerable work-girls, such as Mr Besant has limned in his 'Children of Gibbon' and others of his East End romances, is haunted by an array of shades, some, indeed, of high degree. Two centuries ago it was a charming rural village. It stood at the end of rustic Shoreditch and quiet Old Street, and ran northwards to the fields of Hoxton, which, beginning

by Kingsland Road, stretched right away to the village of Kingsland with its old houses and green. Those famous fields are now covered with streets, squares, 'roads,' and 'groves,' generally known as De Beauvoir Town, and thickly populated, and terminating at Ball's Pond Road, which runs at right angles to the main road north through Kingsland to Stamford Hill and Tottenham. But half a century ago a clear view of pasture and cornfields could be obtained, covering all the space between Kingsland Gate and Stamford Hill villadom.

We dwell thus on these Hoxton fields, and call them famous, for some of the most noted shades who haunt the once pretty village have traversed them. Across them—'to avoid the dust of the roads, and arrive at the Charter House'—came James I., what time he leisurely journeyed from the North to take possession of the throne of England. But a mightier and earlier crowned shade was before him. Henry VIII.—in veritable fact as well as phrase, 'most dread lord' to his subjects—visited, in all the pomp and splendour the Tudors loved, the fields of Hoxton and the village itself, the air resounding with fanfare of trumpet and deep-throated cheering, as the bluff despot watched the archers whom he so fostered contending at the butts; and from the quaint village houses a motley throng gathered to watch with awe their masterful sovereign, 'whose frown would have sent the proudest peer in England to the block.' The burlesque title of the Duke of Shoreditch was bestowed by the king on the Captain, and that of Marquis of Hoxton on the best archer of our historic village; and, by the way, the manor of Hoxton—or Hokestone—has been held by the Dean and Chapter of St Paul's since a time earlier than the Norman Conquest. Thus 'the witty canon of St Paul's' may be said indirectly to be one of the shades which haunt the place.

Nor is James I. our only royal instance. His unhappy successor, when returning from his romantic love-journey to Spain, galloped with Buckingham, his ill-omened *fidus Achates*, across

the fields and down the village for the Bishop's Gate, passing through rural Shoreditch, where lately stood, amid the modern din and turmoil and showy shop architecture of the great thoroughfare of to-day, an Elizabethan-gabled timber house, which must have indeed witnessed many and marvellous vicissitudes in the centuries during which it remained unaltered amid constant metamorphoses. Hardly, in 'his house in Old Street—to which he retired,' curious as it sounds to those who know the incessant din and crowd of that now thickly populated centre of industry, as 'his favourite retreat from the gaiety and bustle of London'—(twelt the now almost forgotten author Samuel Daniel, who flourished in Elizabeth's reign, and wrote 'The Civil Wars between the Two Houses of Lancaster and York,' and whom Drummond of Hawthornden pronounced in rhyming 'second to none.' He cultivated his gardens, and frequently strolled in the evenings into flower-encircled Hoxton, wandering along its long winding street as he composed his poems or his History, for he wrote one of England from the Conquest to Edward III. His style both in prose and verse has, like Dryden's, a most modern aspect; and he wrote some of the poetry for the court entertainments; but ultimately retired 'to a life of contemplation and quiet in the country' near Hoxton.

The village, detached as it was at the beginning of the seventeenth century, and surrounded on all sides by fields—and a century later flowers were gathered in Brick Lane, Spitalfields—was a favourite place of resort for the citizens of credit and renown. Like 'merry Islington,' it was famous for its cakes and ale, also for custards, as appears from allusions in the dramatists and other popular writers of the period. Hither, therefore, came many pleasure-seekers, and among them one of the most inveterate; for, as a modern essayist has shrewdly remarked, nothing is more perceptible in that candid self-portraiture, the Diary of Samuel Pepys, than his many-sided capacity for enjoyment. Pepys passed his childhood at Kingsland, and mentions how, when he was a man of good position, he revisited his ancient haunts, the fields where he shot with his bow and arrows; and, indeed, he frequently took coach along Shoreditch, and so northward. Frequently, too, no doubt, he strolled out of the city gates towards Hoxton, and with that appreciation of good things which we see in every page of his Diary, enjoyed the cakes, ale, and custards, the flower-gardens, and famous elm-trees—the Whitmore family, whose name yet marks several well-known places in the locality, had some magnificent specimens, which were blown down early in George III.'s reign—and the pretty faces that peeped from the flower-enwreathed lattices of the Hoxton cottages. Some of the cottages are there still, but, alas, how different in aspect!

And besides the figure of the loquacious Clerk to the Admiralty of Charles I., one can see with the mental eye various brilliant and roystering figures familiar enough at that monarch's free-and-easy court, who found much diversion in occasionally going so far from the fashionable purlieus of Whitehall as to Hoxton in its rural quiet, there to riotously enjoy its cates and 'syllabubs from the red cows' pasturing in the belt of fields; and also to flirt more or less riotously with the pretty

maidens, who in those days were abundant among the ancient cottages—and who have left some representatives yet in the now long unlovely street, albeit, poor things! their faces are hunger-pinched and toilworn.

Perhaps, however, the shade which haunts Hoxton, of all others the most interesting to every student of English literature, though his name be unfamiliar to most of its present inhabitants, is one whose bodily presentment was often there some seventy or eighty years ago. 'A spare figure in clerly black,' with a melancholy smile, and keen, gentle humorous eyes, seems to flit before us as we pass down the lower end of the long street where still stands Hoxton House, ancient, indeed, in some of its buildings, and for so long a series of years a lunatic asylum. For thither, too, often across the Hoxton fields, now covered with houses, came Charles and Mary Lamb, both weeping as acquaintances have met them, and on their way, poor souls! to the asylum, whither they always went when Mary Lamb—to whom her gifted brother so nobly and unostentatiously devoted his life—felt one of her periodical fits of insanity approaching. Hither, from distant Shacklewell, where Lamb loved to lodge when desiring repose, and which with its ancient green is in great part unaltered as when he wrote some of his Essays, overlooking it the affectionate and sad pair, would journey—perhaps the most pathetic shades in Haunted Hoxton.

POMONA.*

By the Author of *Laddie, Tip Cat, Lil, &c.*

CHAPTER XIX.

For thy sweet love remember'd such wealth brings,
That then I scorn to change my state with kings.

SHAKESPEARE.

'It is not a very good day with mother,' Pomona said, half an hour later, coming into the morning-room, where Sage had been luxuriously waiting in a deep armchair, in which each slight turn of the head brought some fresh beauty into view: the open window and through it the broad lawn, sloping away into thickets of rhododendrons, and beyond that, the park, and a glimpse of bright water through the great trees, and beyond it all, blue distance; or the conservatory, into which another window led, full of richest hues and sweetest fragrance; or the room itself, with pictures and statuary, books and music and flowers everywhere; or even the little table close at hand with its tempting array of scarlet strawberries, iced lemonade, and dainty cakes.

Pomona was looking wistful and sad; for even the separation of a few days was enough to show an alteration in her mother; or, perhaps, as she tried to persuade herself, she had forgotten a little of the weakness and transparent fragility which struck such a pang to her heart now.

'The weather has been trying lately,' Pomona went on with an almost pleading tone in her voice, insisting on finding any reason but the

real and obvious one; 'and she went for rather too long a walk last week. And she has been so looking forward to to-day, and trying to be so well and bright, for my sake, that she has got nervous, and could not sleep just because she was so anxious to be at her best. Martin—that is her maid, you know, who was with her before I was born—says she is wonderfully nervous. Just fancy, Sage, Martin asked me not to talk about Mr Ludlow's picture and its likeness to me. She says that what I said in one of my letters about it seemed quite to worry mother. It is so unlike her, Sage—she used not to be a bit fanciful. She wants to see you presently after lunch; and I told her I was sure you would not mind being left a little to your own devices, as you would quite understand that I should want to be with her on my birthday; and she is so easily overtired if there is more than one in her room.'

Sage was able truthfully to declare that she would not mind if she were left all day to her own devices; and she entreated Pomona to do exactly as she would if she were alone.

'You don't know,' she said, 'how beautiful and new it all is to me. I was only thinking, before you came down, that I could be quite contented to sit here all day and never move.'

'But I shan't let you do that, you dear, little soul. Fancy coming to Beechfield and never moving out of the morning-room! Even if I should allow it, mother wouldn't. She would get right up off her sofa, I believe, and come down to see that you got proper treatment in your own mother's old home. It is yours as well as mine, Sage, so you must feel proud of it too. I will turn on Mrs Stone, the housekeeper, to show you the family pictures, unless you would rather prawl about by yourself. She is a dreadful old bore, there is no denying; she has all the names and dates and painters at the tip of her tongue, and reels them off to the people who come to see the house on the days when it is shown to the public. I used to think her wonderfully clever, when I was a child, to remember it all; but I soon found out that it was just learned off by rote, and that she could not answer any question the least off the beaten track; and that if she got at all put out, or lost the proper succession, she floundered hopelessly, and had to begin all over again. And for my part, I much prefer to invent the histories for myself, and I endowed all those old Lesters with such romantic stories, ever so much more real to me than Mrs Stone's dull, little, historical facts. The advantage I had over her was that I could ignore the unities of time, and bring young hearts together that centuries had divided; and there was no table of kindred and affinity in my world, for I think I frequently allowed a man to marry his pretty, young grandmother.—But I think you ought to be introduced properly to your relations, Sage; and it will gratify poor old Stone so much to do it, that you will have to sacrifice yourself. But come along into the garden, and I want you to see the stables and my dogs before lunch.'

Sage was well content, as she said, to be left

to amuse herself, and to explore the house and gardens and out into the shady glades of the park. She submitted gladly to Mrs Stone's guidance through the picture-gallery; the historical facts that had seemed so dry to Pomona were deeply interesting to Sage, who never till to-day had felt that she had any connection with the events of which she had laboriously mastered the particulars at school. It gave her a little thrill to reflect that an ancestor of hers had raised a troop for King Charles; that another had been attainted of high-treason and had his lands confiscated; that this in stiff ruff and long, pointed, jewelled stomacher had been one of Elizabeth's ladies; and the other—in whose somewhat sensual face Mrs Stone traced a likeness to Sage—had been a court beauty in Charles II.'s time. It seemed to give a reality to history, to fetch it out of the dog's-eared covers of school-books, and set it moving and feeling and breathing before her. And it gave life to people who had been hitherto only names attached to pictures in the National Gallery, not meaning much more than the numbers. Van Dyck, Sir Joshua Reynolds, Gainsborough were real painters like Mr Ludlow, to whom ancestors and ancestresses of hers had sat, just as she and Kitty had sat at Scar.

She looked with respect at the bed in which Queen Elizabeth slept. Did ever queen sleep in more four-posters than good Queen Bess? Future ages will not have a quarter the number to display as the resting-place of Queen Victoria, even if future ages have a quarter of the respectful interest that lingers, even in this radical age, in the uneasy resting-place of a head that wears a crown. She would have liked to have heard a great deal more about some of the relics: the handkerchief that belonged to Marie-Antoinette, the pearl-embroidered glove of Lady Jane Grey, the snuff-box given by Napoleon, &c.; only, she remembered Pomona's warning that vexatious questions annoyed the kind, old housekeeper, who appeared to her a very grand and dignified person, quite justified in the patronising tone she assumed.

She was called away from her examination of these treasures to her interview with Lady Lester. In after-days, looking back on this her only interview with her aunt, she always connected it in her mind with the deer in the park: perhaps it was the great, pathetic, dark eyes that looked so unnaturally large in the pale, wan face; perhaps it was the shadowy, fragile grace; perhaps it was the sense of speedy passing away which impressed her in this still, quiet room, as it had when the dappled herd flitted across the glade out of the shadow, across the sunshine, into the shadow again.

'Here is Sage, dearest,' Pomona said, rising from her low seat by her mother's sofa. 'Now I am going to spare you to her for ten minutes, which I think is very generous of me; and at the end of that time I shall come and turn her out ruthlessly.'

And then Pomona left them together.

'Let me look at you, my dear,' the faint voice said. 'Come and sit down where Mona was.—Yes; you are very like the Lesters, as she said.'

'Father always says I am like my mother.'

'I hardly remember her enough to say, but you are like the old portraits.'

'Pomona is not like them.'

'No.' Lady Lester's eyes closed; and Sage felt that her voice, with the greatest care to soften it, was still rough enough almost to scare the delicate life away; but Lady Lester began speaking again eagerly and hurriedly.

'I wanted very much to see you to ask you to forgive me.'

'What for?'

'For a great wrong.'

'I do not understand,' Sage said. She wished Pomona would come back; she had heard of people in great weakness getting wrong in their heads; and Lady Lester's eyes were bright and burning, and the thin hand that held Sage's grasped it with an almost painful pressure.

'No; how could you understand? Tell me, dear, have you been very poor?'

Sage's hand gave a little, proud start, as if to draw itself away from the detaining clasp.

'You must not be offended. I have so little time to put what I want to say into polite words. Mona will be back directly; and besides—do not tell her—I have not long to live, and may not see you again.'

'I have been very happy,' Sage said. 'I have the kindest, best father in the world, and a most happy home.'

'Yes; that is just what I want to know, that you are happy.'

There was something in the great burning eyes that seemed to draw out from Sage a hint of that greater happiness that had come to her of late, and she went on, with the colour mounting to her cheeks: 'I think sometimes I am the happiest girl in the world.'

'That is right. And you would not change places with any other?'

'Not for worlds.'

'Not with Mona?'

'Not with any one.'

'Am I right, little Sage, in thinking there is some other reason for the happiness? You can't be expected to tell a stranger all about it, though that stranger is an aunt; but I think you would if you knew what a weight it lifts off my conscience to think that what I have done has in no way affected your life's happiness.'

She drew the girl's flushing face towards her with her two soft hands and looked straight into the shy, gray eyes.

'Is he very nice, little Sage, very tender, very true, that for his sake you would not change with Mona or any girl in the world?—God bless you, dear! I shall sleep quieter with the feeling that I have not hurt you.—There is Mona coming—kiss me, and say you forgive me.'

'Indeed, indeed, there is nothing to forgive.'

'Why, mother, I declare you look ever so much brighter and better! I shall be quite jealous of this sly, little, quiet Sage if she can charm away your headache better than I can.'

But the transient life that the excitement of her conversation had imparted soon died away, and such prostration followed that Martin had to be summoned; and the two girls reluctantly left her. Martin promising to call Pomona directly her mother was sufficiently restored for her to return.

The two girls were lingering in the gallery that ran round the large central hall, when the

sound of a carriage at the front door made them draw back.

'Some one come to call,' Pomona said. 'I really can't see them. I think one has a right to do as one likes on one's birthday.'

Presently a silent-footed servant came up the stairs with some cards on a salver, and presented them to Pomona, who glanced at them carelessly.

'I said I thought you were engaged, Miss, as her ladyship was not very well,' the man said.

Pomona had taken up one of the cards and was looking at it hesitatingly. 'How did they know I was down?'

'They came to inquire for her ladyship, and asked when you were expected; so I said you were down for the day, Miss.'

Pomona looked round towards her mother's room.

'Martin promised to call me,' she said doubtfully, 'when mother was a little better. I should not like to miss a minute that I could be with her; but'—And then she looked at the card again uncertainly for a moment, ending, however, by tossing it back on to the salver, saying: 'Yes; say I am only down for a few hours, and I cannot leave Lady Lester.' And then she turned to a large window in the gallery that commanded a view of part of the drive up to the house, and stood there for a few minutes, after the closing of the door and the sound of wheels on the gravel announced that the callers had left.

Sage's artistic eye was struck by the exquisitely graceful picture she made, leaning on the oak window-ledge, with one hand holding back the heavy velvet curtain, and above her the rich colouring of old glass emblazoned with the Lester arms; and beyond, through the open casement, the broad sweep of park and the blue distance. Was it the sun through the crimson glass that cast a sudden flush on the milk-white neck as the sound of wheels died away?

'I wonder,' Sage thought to herself, 'if that caller was any one she cares for? It was a gentleman's card.'

And then a wave of sympathy swept over her, fancying how she would have felt if it had been Maurice driving away; and perhaps her eyes were a little too sympathetic when they met Pomona's, for she turned away with a half-proud, half-shy look, as if the blossom of her confidence was not sufficiently blown to allow of a gaze into its heart.

'I will go and see how mother is,' she said; and then, with a touch of compunction, she put her arm round Sage and kissed her. 'Poor, dear, little Sage. I am treating you very badly, leaving you so much to yourself.'

'Indeed, indeed, Pomona, I do not mind. I could not bear you to stop away from Lady Lester on my account.'

And then Sage went down the great stairs alone, still wondering if Pomona had any one like Maurice, and if that were he who drove away just now.

On the old carved oak table in the hall was the silver salver with the cards lying on it, one of them face downward, as Pomona had tossed it; and Sage stood for a moment looking at it, figuring to herself what Pomona's lover should

be like, how handsome, noble, splendid; and then, hardly thinking what she was doing, or if the curiosity was justifiable, she turned the card over to see the name. It was 'Mr Maurice Moore.'

THE PROPOSED NAVAL INSURANCE FUND.

By CHARLES GLEIG.

THE loss of the battleship 'Victoria,' and the circumstances attending that terrible disaster, are still fresh in the public mind. It may be truly said that in every British home the deepest sympathy was felt for the widows and children of the brave fellows who met death so steadfastly on the 22d of June. The appeal of the Lord Mayor of London on behalf of the dependent relatives was so generously responded to in all parts of the kingdom, and even in the colonies, that within two months the Victoria Relief Fund was swelled to seventy-two thousand pounds, this being by far the greatest fund ever subscribed under similar circumstances. The Fund has since been entrusted to the management of the Royal Patriotic Commission, of which His Royal Highness the Duke of Cambridge is President; and as soon as the necessary inquiries and formalities have been concluded, the widows, orphans, and other dependent relatives will begin to receive small weekly pensions from the Fund thus generously subscribed by the public. As we write, more than three months have elapsed since the sinking of the 'Victoria,' but as yet the Patriotic Commissioners have not been able to issue those weekly pensions. This delay has led to very strong comments in the press and at the naval ports; but it would be outside the scope of the present paper to discuss that question, and we merely allude to the delay that has occurred in support of the contention that the time has arrived when a General Naval Insurance Fund ought surely to be formed.

This project has already been widely discussed at the naval ports, and there is every indication that the petty officers and men of the fleet are desirous of ensuring provision for their families in such a manner as to obviate the necessity of periodically appealing to the public for charity. Such an excellent scheme as this deserves the support of public men, members of Parliament, and even, perhaps, of the Government itself; for every one must admit that the system of relying upon public charity for the support of widows and orphans of men of the royal navy is altogether wrong in principle. It is not that the public grudge the money—this has been clearly exemplified by the loss of the 'Victoria'—but the seamen themselves are earnestly desirous of securing more definite provision for their families; and, for reasons we will endeavour to explain, the establishment of a General Insurance Fund would almost certainly render the naval service more attractive to the rank and file.

Under the present system, or rather lack of system, the widows and children of petty officers and men who lose their lives in the service of the Crown are only entitled to pensions under certain conditions. These pensions, as we shall show, are very small, and, but for the charity

of the public, would be altogether inadequate. Under the second section of the Act 46 and 47 Victoria, the Admiralty are empowered to grant these small weekly pensions to the widows and young children of men who have been killed or drowned on duty, or whose deaths have resulted, within twelve months, from injuries or disease directly due to the service. The regulation is so framed as to greatly restrict the award of these pensions, notwithstanding that the money comes out of the Greenwich Hospital Fund, and not out of the pockets of the taxpayers. It has to be proved to the satisfaction of the Admiralty that a man has met his death actually on duty, or else the widow gets nothing. Thus—to take a very common example—a seaman may be drowned by the capsizing of a waterman's boat, when returning to his ship from leave. In such a case the widow receives no pension. Or, again, a seaman may be robbed and murdered whilst ashore in some semi-civilised country, and here again the widow would be thrown upon the world. This regulation may or may not be regarded as harsh; but in any case the remedy for this state of affairs will never be found in Admiralty circulars, for what is required is obviously a General Insurance Fund upon which all naval men's widows should have a legal and indisputable claim.

But to return for a moment to the existing rules. These Greenwich pensions, granted under fixed regulations, vary in amount from three shillings and sixpence to six shillings and sixpence a week; the widows of seamen, stokers, or marines being entitled to the lowest scale, whilst the widows of petty officers may receive the higher rates. Small allowances are also made to each child, never exceeding two shillings a week; but these cease in the case of boys at fourteen and of girls at sixteen years of age. From these figures it will be observed that the widow of an able seaman left with, say, three young children on her hands would receive a pension of not more than nine shillings and sixpence a week. It has always been necessary on this account to appeal to the charitable instincts of the British public whenever any of Her Majesty's ships have been lost, or even when serious accidents have occurred afloat, such as the bursting of the turret gun on board Her Majesty's ship 'Thunderer.' By this means poor Jack's dependent relatives have been preserved from absolute want; but the system is discreditable to a great maritime nation, and humiliating to the feelings of our seamen.

But there is another point which cannot be passed over in silence, and which in itself affords a strong argument in favour of the proposed scheme of naval insurance. The public is accustomed to subscribe towards the relief of the widows and children in all cases of actual disaster on a large scale, such as the loss of a ship, serious gun accidents, and so forth; but the public is not expected, nor can it be asked, to relieve individual cases of distress, such as those to which we have already alluded. Take the case of a seaman who is killed by falling from aloft, for example. His widow receives the Greenwich pension of three shillings and sixpence a week, and the officers and men of the ship invariably raise a subscription for her benefit;

but here the matter ends, although, of course, the unfortunate woman thus thrown upon the world deserves to be helped just as much as if her husband's life had been sacrificed under more sensational circumstances. Perhaps we have now sufficiently explained the desirability of establishing a system of naval insurance, and may proceed to consider some of the schemes under discussion in the naval ports.

The proposed formation of a General Naval Disaster Fund is not altogether a new project. The Naval Exhibition of 1891 was organised by a Committee of officers with the object of benefiting naval charities; and, thanks to the support of His Royal Highness the Prince of Wales, the undertaking proved very successful. After paying all expenses, the Committee of the Naval Exhibition were able to declare a surplus of £47,246, 6s. 9d., and with this money it was decided to establish a new charity, known as the Royal Naval Fund. The Queen was graciously pleased to become patron of this Society, or Committee of management; the Prince of Wales was appointed President; and it was hoped that the problem of how to make adequate provision for the widows and dependent relatives of men who lost their lives in the navy would at length have been satisfactorily solved. Unfortunately, and in spite of royal patronage and support, this scheme has hitherto failed. It is scarcely necessary to explain that the interest of the capital produced by the Exhibition was in itself far too small to enable the Committee to carry out their scheme. It was confidently anticipated, however—by officers out of touch with the views of the lower deck—that there would be no difficulty in inducing the petty officers and men of the navy to support the scheme. The men were asked to assist in the project by paying one shilling a head per annum; and not a little astonishment was evinced in official circles when, after mature consideration, the men unanimously declined to have anything to do with the scheme. In making this decision, the men of the lower deck were well advised, as we will endeavour to show. The Committee of the Exhibition Fund had vested the administration of the surplus in trustees, who were bound down to apply it in relieving the widows and dependent relatives of men who actually lost their lives in the service, and the men's voluntary contributions would have been expended similarly. The scheme was a good one in many respects; but the men held, and, as we think, rightly, that the principle of excluding the naval pensioners' widows was open to grave objections. If they had accepted the scheme, there can be little doubt, we might have had to wait many years for a really extensive and business-like scheme of naval insurance; whereas, now, there is every prospect of this important question being shortly settled on a much wider basis. In order to make this point clearer to civilians, we should remind our readers that although the widow of a commissioned officer is entitled to a small pension under any circumstances—unless, indeed, she is possessed of considerable private means—the widow of a naval pensioner is considered to have no claim whatever upon the State, and has very frequently to end her days in the workhouse. The men therefore determined to have nothing to do with a scheme framed solely

in the interests of those actually serving afloat. They favoured a much wider scheme.

Now, the loss of the 'Victoria' following so closely upon the wreck of the 'Serpent' has had a very marked effect upon the minds of naval men. The idea of establishing an Insurance scheme was no doubt revived by the Committee of the Exhibition Fund; but the failure of that project damped the ardour of the officers, and for a time it seemed as though the men were inclined to let the whole question drop. But the 'Victoria' disaster has naturally aroused the men; and though the public has subscribed most generously towards the relief of the widows, the loss of so many lives has again directed their attention to the necessity of establishing an extensive scheme of Insurance. There is no longer room for doubt that the men of the lower deck are anxious to help themselves in this matter, and that they are willing to devote a small proportion of their earnings to insuring their lives; but at the same time they are not disposed to give more than a few shillings a year individually, and consequently the scheme cannot be carried out except with official aid. Miss Agnes Weston, 'The Sailor's Friend,' whose name is familiar to most people, has suggested in letters to the press that the Government should advance, without charging interest, a sum of three hundred thousand pounds. The suggestion is startling, but not unreasonable, for Miss Weston points out that there would be no great difficulty in repaying the money after an interval of about forty years. It is a large sum of money to advance, yet it is after all little more than the price of a cruiser, and, moreover, it could be ultimately repaid to the State if properly managed. If any such project should meet with the approval and support of the authorities, the men will be willing to subscribe a shilling a head per month; and it is estimated that those united subscriptions would amount to about forty thousand pounds per annum. Then, again, if the naval pensioners are included in the scheme, and allowed to share in the benefits, the annual subscription would, of course, be very largely augmented.

Another very practical scheme has been suggested by Admiral of the Fleet Sir Thomas Symonds, a distinguished officer, who periodically endeavours to persuade the Government of the day to increase the strength of the navy, and whose name should also be familiar to the public. Sir T. Symonds has pointed out that the Admiralty have long been making a clear profit of more than twenty-five thousand pounds per annum on the victualling of the fleet, and the gallant officer holds that this surplus should be utilised for the benefit of the men. It is so perfectly certain that this saving will be effected, that the victualling vote is correspondingly reduced before being submitted to Parliament. Many will no doubt agree that the country could well afford to dispense with this economy; and if the Government should be willing to pay this annual surplus into a Naval Insurance Fund, the necessary balance could readily be made up by the men's subscriptions.

Still another project has been widely discussed at the home ports, which is greatly favoured by the seamen. The Commissioners of the Patriotic

Fund still have control of the numerous funds subscribed by the public for the relief of widows of seamen. None of the funds have been materially reduced, because the Commissioners have wisely expended only the interest, so that in course of time, as death gradually settles all claims, the Commissioners will find themselves possessed of a large surplus. This money will, of course, have to be utilised for the benefit of the navy, and it is suggested that the time has arrived when the various surpluses might be amalgamated, and devoted to forming the nucleus of the proposed Insurance Fund. No doubt, if the money can be spared for this purpose, the Commissioners should consider the project; but the amount of money at their disposal would not of itself go very far. Of the 'Captain' Relief Fund, £31,534 remains; of the 'Eurydice' Fund, £14,472; and of the 'Atalanta' Fund, £7500. Lieutenant-colonel Young, Secretary to the Patriotic Commission, has recently stated, however, that it is proposed to devote any surplus of the 'Victoria' Fund to forming the nucleus of a General Disaster Fund, and it is not improbable that the trustees of the Naval Exhibition Fund may be induced to lend their support to this project.

It must be remembered, however, that those Naval Funds are carefully safeguarded by deeds of trust, and that there may be difficulties in the way of the trustees which would prevent the proposed amalgamation of surpluses for several years to come. Meanwhile, there is the danger of present inaction to be considered. At the present moment the men of the fleet are keenly alive to the desirability of forming a Naval Insurance Fund, and there would be no difficulty in persuading them to submit to a small compulsory levy on their pay. If the Admiralty will bestir themselves in this matter, the result is not doubtful; otherwise, it is much to be feared that the Naval Insurance scheme may remain in dreamland for years to come.

LESS THAN KIN.

A STORY IN FIVE CHAPTERS.

By MRS WILL C. HAWKESLEY.

CHAPTER I.

It was a pretty cottage, that at which the dingy cab, engaged at Havant Station, drew up one wet June evening. Pretty, notwithstanding the weather which caused the roses, climbing up the front and peeping in at the windows, to nod their moist, bedraggled heads, and which weighted with damp the vine-leaves overshadowing the porch. Yet, in spite of its rural beauty, that it would be an empty dwelling in a very few hours was evident, for the curtainless casements looked bare and wretched, bits of straw displayed their ungainly length against the dark mould of the flower-beds and upon the yellow gravel of the sodden path; whilst over everything was written, as plainly to be read as the two short words upon the board by the gate, 'To Let.'

'I'm glad we had the covered vans, though they are so much more expensive,' remarked Mildred Russell to her husband as she flattened

her nose—a well-shaped nose enough under more favourable circumstances—against the panes and stared out into the twilight. 'Every atom of furniture would have been ruined otherwise.'

'My dearest Milly, all your arrangements are wise!' declared the clergyman behind her. 'Fancy arriving at Denleigh with never a dry chair to offer the expectant parishioner. Avaunt the notion!'

'You're a goose. You'll have to improve, now that you're a Vicar, really, Charlie. Oh, you must! And treat me with the dignity becoming my position too. Just promise to try, will you?'

'Promise? I'll promise anything!' At which his wife laughed, understanding that reply of old. 'There's a knock at the street door now, and a fine opportunity to begin my career of respect.—No; you don't,' as she showed signs of herself answering the summons. 'In the absence of the domestic, such menial offices naturally devolve upon the obedient husband. Permit me, madam!' With another peal of the merriest laughter, Mrs Russell sank upon the chair he was offering.

'How nice! And what a change,' she remarked, looking saucily up into his face. 'But really, if you are going to act butler'—

He was already in the hall, threading a careful path between the packages that encumbered the house entrance. In another instant his wife heard the sound of the turning handle, and of his voice offering an astonished greeting. 'My dear Jack! What on earth brings you here? And to-night. Come in out of the wet—do! Give me your goods.'

Mildred was beside him by this time. Having caught the first three syllables, she had waited in state no longer. 'Oh, Mr Duntry, how delightful of you! We were just wanting somebody to cheer us up—weren't we, Charlie?' with her pretty smile. 'Take care, you clumsy creature. You'll drop—Why, it's a baby!' For a little startled cry suddenly proceeded from the rolled-up bundle, which Charlie, believing it to contain nothing but shawls and rugs, had unceremoniously tucked under his arm, and now, in his astonishment, must inevitably have dropped, had not Milly's hands closed upon it.

Without a thought of anything but the child, who was beginning to scream loudly, the lady turned abruptly and led the way into the sitting-room. At least there was a chair there, if only the oldest of kitchen properties, upon which she could deposit herself and investigate her burden. Which she immediately proceeded to do, ultimately bringing to light a 'iny creature, with the reddest of red faces, and the smallest of clenched fists, with which later it beat wildly at the air, violently yelling the whole time. Mildred caught it closely to her breast and looked up, with a world of inquiry in her gaze, at her guest, who by this time had entered, followed by the wondering cleric.

'That's the way she's been going on all day,' Jack Daintry exclaimed, despairingly.—'Oh, Mrs Russell, I can't bear it—I can't bear it! Quiet her, if you can—do. My poor wee girl.' And he stooped to kiss the smooth head, that was jogging itself up and down furiously upon Mildred's shoulder. When he raised himself, she

saw that great drops, not attributable to the rain, were in his eyes.

'The child's hungry, I believe. When was she fed last?' going straight, as was her wont, to the practical side of the matter.

'This morning. Before we started from London, I suppose. At least—I— Oh, how shall I make you understand?' With which final exclamation he suddenly sank upon his knees by the rickety table, and bowing his head upon the hard wood, burst into sobs. Mildred and her husband exchanged glances.

'Here, Charlie, take her for a moment; I'll get what she wants,' cried Milly, though a great lump had risen in her throat, and she felt more inclined to join her tears with Jack's than to do anything more useful. That, however did not hinder her quick movements, which in five minutes resulted in producing a baby's feeding-bottle, filled with warm milk and water, upon which the half-famished infant at once set to work, giving vent the while to little gurgles of satisfaction.

'Wasn't it lucky I had kept our Dick's bottle to give to Mrs Jones for Mary?' Mildred remarked, as she held one soft hand in her own, and watched the stormy face subside into peaceful sleepiness.—'But, Charlie, I expect Mr Daintry is hungry too. Do go and fetch the cold meat. It's on the top shelf of the cupboard, and so is the solitary loaf we possess. As to knives and forks, you must rummage for them. Such are the exigences of a move,' turning to the visitor, who had by this time dried his eyes, with a sort of tired pathetic movement that touched the spectators more than any words. 'He's in awful trouble, whatever it may be,' was the thought in Mrs Russell's mind.

The supper arrived by-and-by; and although at the first sight of food Jack shrank back with a half-shudder, the refreshment did him good when he began to eat. Gradually the nervous quivering about his delicately cut mouth ceased, and the miserable heaving of his chest grew less noticeable. When at length he pushed away his plate and turned to the fire, he certainly seemed revived.

'You're worn out, old fellow,' exclaimed Charlie, with ready sympathy.

'Nearly'—pressing his fingers to his forehead. 'But how good you've been,' stretching out the other hand—a very weak, womanish hand it looked—and laying it upon Charlie's far more healthy member. 'You always were better than anybody else.'

'Oh, always!'—with a laugh, that for once was not the reflex of his feelings. 'And now, who is this young person?'—pointing to the child upon his wife's knee.

'My own daughter'—with an air half sorrowful, half proud. 'Ah, Charlie, you didn't know I was married?'

'No, indeed. How should I? when you haven't written for'—

'Two years,' finished Mildred, as he paused. 'I remember, if you don't! You see, I consider my husband's friends are my friends too, Mr Daintry.'

'I know,' answering her smile with another, sadder than tears. 'But let me tell you my story.

It won't be a long one, for I'm too fagged myself to want to weary you.'

'No fear of that,' from Charlie. But the other did not heed the interruption.

'I married—her a year ago. She was my landlady's daughter,' he began, in short, jerky sentences. 'Whilst I was studying in London I had rooms in her mother's house, and so made her acquaintance. Afterwards, Mrs Dawson died, and she was left quite alone. So my twenty-first birthday was also our wedding-day. She was the sweetest, daintiest creature. And she died just a fortnight ago, when this little one was born.—Mrs Russell, she was starved to death!' He drew a deep breath, as of a creature in physical agony. Then, as no one spoke—for what was there to say in reply to such an awful statement as that?—he went on again.

'We were married without my father's knowledge. But it came to his ears, and he stopped my allowance then and there. That was within a month of the wedding. I went and pleaded with him. He listened and laughed; and I flung out of the house in anger. But worse times came. We pawned—her—wedding ring to get enough money for our railway fares, and went again—together! But he would not so much as see us. We never redeemed that ring.'

Once more he stopped. Mildred's tears were falling fast upon the white dress of the motherless baby, and Charlie was shading his eyes with his hand. But now, whilst he recurred in memory to the deepest depths of his misery, Jack's own eyes, which overflowed so freely half an hour ago, were dry.

'When she was dying, I went again to Rushton, spending my last penny. I had better have saved it to buy food for—her,' with the pause he invariably made before each reference to his dead wife. 'I did see Sir George then. I told him that she was perishing from actual want. And he answered that it was what he wished. To get rid of her was the best he could do for me. After that, can I give him my little Ena?'

There was no determination in his tone, only the sad depression that had characterised his manner ever since he entered, and that told of the crushing torture of mind and body through which he must have passed. Charles Russell, remembering him as he used to be, weak but high-spirited, passionate but affectionate, could scarcely believe this to be his father's old pupil and favourite, who at one time had been to himself more than most younger brothers are. But it was not he who first replied to the pathetic appeal.

'Give him this baby? Ena, too! What a pretty name!'

'It was her mother's. Her people had been yeomen-farmers, and could trace their pedigree back to Saxon times. Longer than I can follow my own,' from Jack, with a melancholy smile.

'Really? But of course Sir George cannot have her. Why,' very hotly, 'he might teach her to despise her own mother, which would be dreadful! You'll keep her yourself, Mr Daintry. I can tell you a lot about babies, because there's our small Dick, you remember. Oh, she'll be such a companion'—

But he interrupted her. 'I can't bear my life here,' he said. 'I've no resources either, because

I'd rather die, and so follow—her, than go, on my own behalf, to my father, after'—

Mildred nodded a full comprehension of the unuttered words.

'He has my eldest brother and his boys to console him. Duke will never transgress in the way I did'—with a slight curl of his lips. 'As to work, there's none to be had in England; or if there is, I can't find it. But an old friend, whom I knocked against yesterday— You remember Dolby, Russell?'

'Oh yes.'

'Well, he offered me a ticket for the States. He's been in low-water too, and had actually booked his passage out, when he came in for a legacy. And as he had some notion, I suppose, that I was hard up, he gave me the chance of this windfall. The ship starts to-morrow.'

There was a silence when he paused. Of course the husband and wife guessed, more or less, of the request which was to be made, and were already meditating upon the matter. They were not rich by any means, in spite of the living to which the clergyman had just been appointed, the revenues of which were, indeed, barely two hundred a year. And they had themselves a five-year old toddler for whom to provide. Yet all Mildred's womanly heart had gone out to the infant whose little fingers were in her own warm grasp, and whose deep breathing, still broken by an occasional sob, alone disturbed the stillness; whilst Mr Russell was endeavouring to find an excuse for his own desire to have another prattler about the house in the consideration of the benefit that Dick might derive from such society. By the time that Jack found courage to give voice to his wishes, there was small danger that he would be met with a refusal.

'Mrs Russell, will you take her and bring her up as your own? Don't let any one know that she has no mother. In you she'll find one, poor little soul. And if she never hears the truth, she cannot feel desolate.'

Mildred had believed herself prepared for anything; but she opened her eyes at that. 'But you'll be coming back and wanting her by-and-by,' she urged.

'Then I am sure that you won't dispute my claim,' with another of those dreadfully mirthless smiles. 'But I don't believe that I shall ever ask you to give her up. It is possible. But I have a presentiment'—

'Bosh!' from Charles. 'You always were as superstitious as you were high, and that's saying a good deal.'

'Well, presentiments sometimes come true, at any rate. And if mine should, will you keep the child?'

The eyes of husband and wife met, making inquiry each of the other, as usual. True, that these two had been married for six long years of sunshine and shadow, but they were still lovers as fond—nay, much fonder—than when they plighted their troth. And they had not lost the lover's faculty of thought-reading.

'There must positively be one condition, then: her grandfather must be acquainted with the child's whereabouts. You can draw up a will, leaving her guardianship to me, in case of your own death. But, in fairness to everybody, Sir George Daintry must be told.'

And so it was settled. Using such legal knowledge as his never arduous studies had acquired for him, John Daintry bequeathed his one treasure to his friend, and wrote a brief note to his father before he quitted the house. Then, silently grasping Mildred's hand, and kissing the brow of the slumbering Ena, he took his voiceless farewell—for ever, in this world; for the ship that sailed with him on board arrived at New York with one short in the complement of her passengers. During a gale, encountered in the Atlantic, a furious gust of wind had torn a heavy rope from its fastenings and swept it across the deck, from which every landsman but one had long since disappeared. Like a serpent the long line coiled itself round the solitary idler, carrying him along in its flight; and before help could reach him, it was too late. The great billows had closed above Jack Daintry's head, hiding him and his broken heart in their gray depths until the day of resurrection shall call him forth.

And little Ena was an orphan.

A COREAN ROYAL RECEPTION.

CHOSŌN, the Land of the Morning Calm, has been for ages a closed book to European travellers and merchants, till within the last ten years, during which the hatred of the people to all foreigners has to some extent been overcome, and the country been opened up to Western civilisation. Treaty ports have been established, and the upper classes, at least, are fast learning foreign ways. The king himself is an enlightened man, and does all he can to introduce foreign customs and appliances into the country. Unlike his Chinese suzerain, he is only too glad to see the foreign representatives, and often invites them to Court festivities. A short account of one of these, held in honour of the queen's birthday, may not be uninteresting to English readers.

It was a cold afternoon in December that we started off in our official sedan-chairs, carried by eight bearers, for the palace. My chief was resplendent in silver-laced uniform and cocked-hat; for myself, not yet being the proud possessor of a uniform, I wore evening dress—rather an airy costume under the circumstances! After about half an hour's ride, we reached the outer gates of the palace, where a throng of people, in white robes and black high-crowned hats, lounged about, gazing at the foreign visitors. On all sides were official chairs, supported on long poles or covered with leopards' skins, the Corean emblem of rank. Preceded by our 'keso,' or flag-bearer, we passed through the gates, and walked through several large courtyards filled with soldiers, servants, and musicians, the last being dressed in scarlet. At some of the gates the sentries presented arms in a casual sort of way; at others, they took no notice of us at all; the discipline of the Corean army being decidedly lax, so much so that the guard at one of the inner gates was fast asleep, weighed down probably by the ponderous suit of chain-armour

which he wore. At last we reached the ante-chamber, where we were to wait till the king was ready to receive us, the representatives of each nation going into the audience chamber separately. Here were gathered some of the highest officials and nobles of the country—Presidents of Boards, Generals, and such-like 'great men'—dressed in dark green robes, high hats, and belts of wood inlaid with rhinoceros' horn—the Chinese dress of the Ming dynasty. They bowed, smiled, and shook hands most affably, setting chairs for us in an inner room, where a concourse of brilliant uniforms denoted the presence of the foreign representatives. The Japanese were especially noticeable for a superabundance of gold lace and cocked-hats out of all proportion to the size of the wearer.

After a while, a Court interpreter came bustling in to say that our turn had come and the king would see us; so, doffing our overcoats, we followed him out into the open air, across a courtyard and up some steps into a pavilion, the floor of which was covered with matting. On this our guide prostrated himself, and we bowed, although I as yet saw nothing to bow at. Crossing the pavilion, we went up into a dimly lighted hall, where I could just make out a personage—evidently the king—dressed in red robes, sitting cross-legged before a table, surrounded by a few courtiers. We advanced, and went through the necessary bowings and scrapings, standing quite close up to the table, which was covered by a foreign cloth of brilliant pattern. Our interpreter, bending forward, translated the king's words to us, in a subdued tone of voice. His Majesty asked after our Queen's health, where she had been staying lately, and other questions of a like nature. Suitable answers were returned; and after I had been presented and inspected by the king, the interview ended, and we backed out of the hall as gracefully as possible on a floor covered with uneven matting. The king struck me as an intelligent-looking man, with pale face and a pleasant expression, especially when he smiled.

We were now conducted to a smaller pavilion, where the Crown Prince stood to receive us. Mentors stood on each side to prompt him, and he seemed to be a very nervous youth. He was dressed in a brown robe, and bore no resemblance to the king, his father. After a few minutes, we withdrew and went back to the anteroom, there to wait till all the audiences were over.

In about half an hour's time we put on our hats and coats and marched off in a body to an inner building in the palace, past the Examination grounds and 'a foreign-built clock-tower. Dinner was laid in a long room, outside which a tent of matting, raised about eight feet from the ground, had been erected. The wooden floor was covered with matting, and here the dancing was to take place after dinner. We had to wait some time till all the preparations for dinner were completed, pacing up and down to keep ourselves warm, for it was bitterly cold outside, and the wind blew through the matting most persistently. The arrangements did not seem quite complete; officials were in consultation; the *menu*—on a large roll of paper—was being drawn up by the head-cook, a stout, comfortable-

looking person, dressed in green: servants were rushing about in all directions, placing knives and forks on the table, only to take them up next moment and run away with them. The electric light, too, was refractory, and evinced a desire to flare up suddenly and then go out, leaving the assembly in total darkness. It needed the combined efforts of two or three Presidents of Boards and the head-cook to set it going satisfactorily.

Then a difficulty arose as to how we were to be seated, some of the foreign representatives being very particular on this point. At last all was settled, and we took our seats, Koreans and foreigners alternately, the President of the Foreign Office at one end of the table, and the President of the Home Office at the other. The dinner was served in foreign style, and was good, although the quantity rather exceeded the quality of the dishes. There was a succession of pigeon, duck, chicken, pheasant, bustard, not to mention roast beef, mutton, and other joints. Puddings we had of many kinds, and fruit in abundance. The dinner must have lasted an hour and a half, when the President rose and proposed the health of the Sovereigns of Foreign Powers, which was duly responded to by the toast of the health of the king of Korea.

Cigars were then handed round, and we adjourned to the afore-mentioned tent, where a bevy of dancing girls, who had previously been flattening their noses against the windows of the dining-room, awaited us, arrayed in all the colors of the rainbow. They wore baggy silk trousers gathered in at the ankles; and gowns of red, blue, and yellow, reaching to below the knee, with long sleeves, which they waved about when dancing. Their waists were placed immediately below the armpits, and there was no attempt at tight lacing. All had glossy black hair, drawn back from the forehead, with huge head-dresses of artificial hair and flowers—not unbecoming. They numbered about eighty in all, of ages ranging, apparently, from ten to thirty. At a given signal, the musicians, who were seated cross-legged on the floor at the other end of the hall, struck up a weird, barbaric chant; and a band of girls with arms outstretched advanced at a slow, measured pace, swaying the body to the time of the music and placing their little slippered feet with a swing on the ground, while they chanted a monotonous dirge, every now and then changing suddenly to a higher key. The effect was curious, and rather pleasing. The dance consisted in moving backwards and forwards, in and out, now almost touching the ground with a graceful sweep of their long sleeves, now pirouetting on their heels. Just as this rhythmic movement was beginning to grow monotonous, the castanets rattled, and the music and dancing ceased abruptly.

It would fill a book to give a description of all the different dances they went through that evening. An account of some of the more striking figures will give an idea of the whole performance. For instance, a wooden frame about eight feet high, upright on a stand, was wheeled in by the attendants. It was painted in gaudy colours, and had a round hole at the top, through which a silken ball had to be thrown. Two girls advanced from opposite sides and

began swaying about to the sound of music, every now and then making a swoop down on the ball, which lay in front of them. At length, each girl picked up her ball, and, while swaying from side to side, made feints at throwing it through the hole. Suddenly one girl made a lucky shot and pitched hers through; whereupon she knelt down, whilst an attendant damsel placed a flower in her hair in token of victory. The other, meanwhile, had also thrown, but unsuccessfully, so she received a daub of black on her cheek, and then retired crestfallen into the ranks, while her more fortunate sister received a piece of silk as a reward. Another pair now took their places before the frame, and the same performance was gone through again, till all had had their turn. The dancers then formed into two columns, the successful ones carrying their pieces of silk on one side, the unsuccessful on the other. They marched round once or twice, and then dispersed as the music stopped.

Another interesting figure was the sword-dance, performed by four girls, dressed in crimson and yellow silk, with feathered head-dresses, to represent soldiers. Eight swords were laid on the ground in a circle. The girls began, as usual, to sway about; then as the music quickened, they picked up their swords, one in each hand, and began waving them round their heads. The band played faster and faster; and the dancers twirled their swords in the most wonderful manner, never seeming to tire, although the strain on the wrists must have been tremendous. Now they began to jump about, making pretence to rush at each other, and then as quickly retreating, throwing themselves into the most extraordinary attitudes. This lasted for quite a quarter of an hour, and was the most lively performance of the evening, eliciting great applause from the onlookers. Suddenly they stopped, and, starting a low monotonous chant, marched round several times and then retired to their places. After this, men dressed up to represent gigantic storks and tigers came dancing in, imitating the movements of the creatures very cleverly. They varied their entertainment by making dashes at the girls, who tried to escape their clutches by running about in all directions, screaming and laughing. The performance closed with a grand march round of the whole corps of dancers, a high-coloured junk in the middle, in which a little girl was seated, turning slowly round on its axis, as the other girls marched round, singing as before. The whole effect was very pleasing, and formed a sight not easily to be forgotten.

By this time the clock was striking eleven, and we hurried off to our chairs, after having said good-bye to the President and other officials. A slight stoppage occurred at one of the inner gates, owing to its being locked and the key having been carried off into safe-keeping for the night. The king's permission was needed to open it, as well as to obtain the key, which was at last brought, and proved to be quite a giant of its kind, being at least a foot long, made of solid iron. It took several men to turn it in the lock and push open the great gates, through which we passed escorted by a guard of soldiers, who volunteered their services to conduct us home, in the hope of receiving some present next day. At last the

outer gates were reached, where our chairs awaited us. We hurried through the deserted streets; and so, as Mr Pepys would have said had he been there, 'home to bed, well pleased.'

THE BRONZE MEDALLION.

THE people who drop into my studio and examine the various objects of art and virtu which a long life and a considerable success in my profession have enabled me to collect together, would no doubt be very much surprised to hear that of all my treasures there is none so dear to me as the Bronze Medallion that lies enshrined within a crystal case on my mantel-piece. Many of my visitors have glanced at it, and turned away to examine a rare bit of carving, or an almost priceless example of some forgotten art. To them the bronze medallion suggested nothing; possibly they thought—if they gave the matter any thought at all—that it was some medal won in my student days, and therefore treasured with care. That it represented a whole life-history, and had the power to revive many strange memories, they had no idea. Some people, perhaps, seeing it in a place of honour amongst my knick-knacks, may have fancied that it was something for which I had the same superstitious reverence that other men give to a horse-shoe. The bronze medallion, however, is neither a fetiche nor a memento of an early artistic success; it is simply an insignificant object, worth perhaps a few shillings, which has played no small part in my life, and on one occasion saved me from a sudden and violent death.

Thirty years ago, when I was a young man of twenty-six, and had fame and fortune still eluding me, I was attached to the artistic staff of the *Illustrated Weekly*, a journal which was just then beginning a career of great success. Black and white work was not then what it is now; but people thought highly of the illustrations we were able to give them for sixpence, and there was no lack of encouragement for proprietors or artists. My own special forte was animal life, as it always has been. From the time when I could first hold a pencil, I had spent my happiest moments in drawing horses. To me a horse was a creature of infinite artistic possibilities. I had drawn him sitting in the ring of a circus and galloping at express speed over a racecourse, and it mattered little to me whether he was a high-bred or a shaggy Shetland pony. I had already begun to paint him in oils, and my first picture, 'Young Horses at Play,' was considered worthy of a place in the Academy. It was this success in depicting horses that led the editor of the *Illustrated Weekly* to suggest that I should go down to Doncaster and make a sketch of the St Leger of that year. There was some famous horse running—I forget his name for the moment—and the public interest in the race was greater than usual. Consequently, the proprietors determined to give a double-page illustration of the scene; and I travelled to Doncaster a day or two before the event, and began my work by getting an accurate idea of the racecourse, and selecting a favourable standpoint from which to focus my sketch.

The day of the great race came, and during the morning I was busily occupied in interviewing the various horses engaged, and in filling my sketch-book with bits that seemed likely to be useful. When the afternoon came round and the racing began, I made my way to a certain part of the course which had seemed to me very well suited to my purposes, and there I took up my stand. There were two races to be run before the St Leger; and while these were being got through, and during the intervals between them, I occupied myself in watching the doings of the crowd which filled the upper part of the town moor. There must have been two hundred thousand people present on the stands and in the rings and on the moor, and from them came a perfect babel of sound, above which the stentorian voices of the bookmakers blended with the shrill cries of catchpenny adventurers of all sorts. Here two or three members of the three-card-trick fraternity were endeavouring to gull a group of round-faced rustics; there, a similar gang were shouting the praises of a sort of roulette table; yonder, a betting-man had screamed himself hoarse, and was reduced to shaking the money in his bag as a means of attracting attention. Beyond the shouting, swaying, bustling crowd stretched a long line of vehicles of all descriptions, from the lordly-looking coach to the farmer's light cart, and on these men and women were eating and drinking and discussing the prospects of the favourite for the great race. Across the course rose the long line of stands, thickly packed with fashionable race-goers, and these made a dark background to the picture I had in my mind's eye.

I was noticing all these things, and taking a sly sketch now and then of some face or figure that attracted my attention, when I caught sight of a little gentleman, evidently a Frenchman, who seemed very much out of place amongst the rough crowd. He was very neatly dressed from top to toe; but as he passed me I noticed that his black frock coat was somewhat shiny at the shoulders, and that his carefully brushed hat had certainly seen better days. He went in and out amongst the crowd, staring at the bookmakers, and glancing curiously at the three-card fraternity. I thought there was something wistful about his eyes as he looked at the gold which these gentry displayed so lavishly. Presently I lost sight of him in the crowd; but about ten minutes before the St Leger was to be run, I saw him again. He was engaged in confidential conversation with an individual whom I set down at once as a betting-man's tout, and against whose wiles and blandishments I should have liked to warn the evidently innocent foreigner. Presently, however, there was a great cry of 'They're off!' and I had to turn my attention to the race.

However great the excitement, and however long it may have existed prior to the event which rouses it, it takes but a few very brief moments to allay it for ever. Within four minutes of the cry of 'They're off!' the horses had flashed past me and past the winning-post, and the great race was over. I strolled round the crowd and amused myself by watching the faces of the people who had lost their money, and the joyful

manifestations of those who had betted successfully. I passed beyond the line of carriages and carts, and walked across the moor to the slight hill at the bottom of the course, from whence there is an excellent view of the crowds gathered before the stands. There were very few people about the hill or the furze-bushes which cover it, and things were quiet there after the roar and bustle of the crowd. I turned away to the left, intending to go into the high-road and walk back to the town; but I suddenly paused and hesitated, for there, close before me, was the little French gentleman, evidently in distress. He sat on the ground behind one of the furze-bushes with his hands hanging helplessly over his drawn-up knees, and his head drooping forward in abject fashion. It was evident that he had fallen amongst thieves. I went up to him and spoke, feeling that his distress warranted me in doing so.

'I am afraid you are in trouble, sir,' I said.

He lifted his face from his hands and looked up. 'Ah, m'sieur!' He spread his little fat hands abroad with a gesture that was half pathetic, half comical. 'Hélas, I have been robbed—swindled—I have lost all my moneys.'

'Do you mean that some one has picked your pocket?' I asked. 'If so, you should inform the police.'

'Ah, but it is not zat zey have peek my pockeet!' he answered quickly. 'It is zat I am one big fool—I bet—I stake—I gives my money to ze maker of books, and—pho! it is gone.'

'Ah, you have been betting.'

'Hélas, m'sieur, yes. You see, I am—ah, but!—I am poor. I am Professor of Languages at seexty pounds a year. It is ver' leetle for Madame my spouse, and for Jules and myself, and I often zink of how I can make heem more. A yong man say to me, "You should bet," "You should put your money on ze horses." He talk to me, zis yong man, of tens to one, and seex to one, and I listen. Zen yesterday comes, and zey pay ze salary at my school. Zey pay me five pound, and I put heem in my pocket and say, "To-morrow I will go to see ze horses-race and win much money." So I arrive here at ze course, m'sieur, and I walks round and see the makers of books, and I talk with a gentleman of sport who knows what he calls "a sure teep," and he tells me to put my five pound on "Crocodile," and takes me to a man who gives me a teecket, and lays me seexty to one against ze horse "Crocodile." Zen I say zat "Crocodile" will win me three hundred pound; and we will be happy, and my leetle Jules shall have a new coat, and Madame my spouse will buy herself a new gown, and I shall have great joy. And zen they run, the horses; and when zey have finish I go to my maker of books and request my money. And he say "Crocodile" is nowhere at all, and my five pound is lost; and ze man zat gave me ze "sure teep" is gone, and—hélas, m'sieur, now I have no salary to take home!'

And here the little man broke down and wept. Half-amused as I was at his story, I felt sorry for him, for I could well imagine that the loss of his five pounds would mean a good deal to him and to Madame his spouse and their boy Jules. When he had recovered himself a little, I talked further with him, and found that he was

a political refugee, and that he taught French in a boys' school at Doncaster. Convinced that his tale was genuine, I determined to help him. I had a five-pound note in my pocket for which I had no immediate need, and I made up my mind that he should have it. As I did not desire to pose as a benefactor, however, I resolved to adopt a little ruse.

'Well, sir,' said I, 'these fellows have swindled you, of course. To begin with, you should not have talked to the man who professed to know of a sure tip. All he wanted was your money'—

'Hélas, m'sieur, I am great fool—yes,' he interrupted, smiting his forehead. 'I have a head of wood. But it was the desire to carry home much money to my spouse and to cry, "Behold a fortune!"'

'And have you really nothing to go on with, sir?' I inquired.

He blushed and hung his head. 'Ah, m'sieur,' he said, 'not one centime. It is hard work to live on ze five pound a month. And now I have gamble heem away, my beautiful five-pound note, and zere will be no money for ze baker and ze butcher; and Madame my spouse will weep, and— Ah, wretched traitor zat I am!'

'Come, come, sir,' said I; 'don't give way. Here, you stay there awhile, and I'll go and see if I can't recover your money. Which of the betting-men was it that you gave your note to?'

'The gentleman called "Old Toby from London," m'sieur. He zat stands near the refreshments with a wonderful hat upon his head, and a long white coat.'

'Well, stay there,' said I, 'and I will see "Old Toby," and try to get your money; and away I went back to the crowd. But I had no intention of going near "Old Toby from London;" and after I had taken a turn through the people, I returned to the furze-bushes with my own five-pound note in my hand. I held it out to the little Frenchman, who received it with extravagant expressions of relief and delight.'

'There's your five pounds, sir,' I said; 'and I hope you'll never be tempted to bet again.'

'Ah, m'sieur, indeed, no! I promise you on my sacred word, and I beseech you to accept my'— Here he broke off and looked fixedly from me to the note, which he had smoothed out. He turned pale, then red, then pale again.

'What's the matter, sir?' said I. 'Isn't that right?'

'M'sieur!' He drew his little figure to its full height. 'Zis is not my note. See, I take ze numbaire of heem—it is 200317. And see, ze numbaire of zis note is 521683. Ah—ah—m'sieur, I see how it is! Your generous heart weeps for my poor leetle Jules and for Madame my spouse, and you give me zis money out of your own pocket. Ah, beautiful sympathy—it makes me weep.' And he began to shed more tears. I turned to go, feeling somewhat confused. 'Good-day, sir,' I said.

The little Frenchman seized my hand. 'I zank you, m'sieur,' he said simply; 'I zank you from my heart.'

'You are very welcome,' said I, and hastened to leave him.

Before I had proceeded many yards, he ran after me. 'M'sieur,' said he, 'take zis leetle

object as a memento. You will zink of Hector Malan and his gratitude when you see it. It is nothing—a leetle medal zat my son Jules win at ze school, m'sieur. I zank you again, and I pray ze good God to reward you.'

I took the little bronze medallion which he put into my hand, and went on my way again. That night on my way to town I looked at the memento of my somewhat amusing adventure; it was a bronze medal rather larger than a crown piece. One side bore a figure of Learning bestowing a laurel wreath on a kneeling child; the other informed me that the medal had been presented to Master Jules Malan for his proficiency in mathematics. I put the little token in my purse and thought no more of it until some weeks later, when I happened to be dining with a fellow-artist at a restaurant, and once more came across it amidst a handful of loose change. I handed it over to my friend, and told him the story as we walked away together.

'If that medal were mine,' said he, 'I should attach a sort of superstitious reverence to it. I should look on it as a species of lucky-penny, and always carry it about my person.'

I laughed at the idea; but I put the bronze medallion back into my purse, and there it stayed. I attached no sort of value to it; but it seemed somehow to become a fixture, and had an inner compartment of my purse all to itself.

Some years went by. I worked hard at my profession, and began to be known as a painter of animal life, and especially of horses. A battle-scene of mine, 'Horses in War,' brought me an invitation from my old friends the proprietors of the *Illustrated Weekly* to go out as war-artist during the Franco-Prussian campaign. I was disposed to go before the invitation reached me. I was unmarried; I had no ties; and there seemed no reason why I should not see something of war at first hand. Accordingly, I accepted the invitation; and within a week I was with the Prussian forces near Saarbruck. I am not writing the history of that famous campaign, and I shall therefore pass over the preliminary events of the war, and go on to the time when the Prussians, having easily recovered from their first reverses, poured over Alsace and Lorraine and began to besiege Strasburg and Metz. I, in company with several other English war correspondents and artists, was with the advance corps of the attacking army, and had considerable difficulty in getting on at all. The Prussian military authorities had small love for special correspondents, and we were indebted solely to ourselves for whatever information we got. To me this official stand-offishness did not so much matter as to my companions, the special correspondents. My business was to make pictures, theirs to find news. Nevertheless, I found it hard work sometimes to get materials for my sketches; and the risks I occasionally ran were greater than those which I should have incurred had I mixed in the thick of the skirmishes, which went on continually.

It was a cold, damp afternoon in October, and we were lying half-way betwixt Bonzonville and Gravelotte, about nine miles from Metz. The Prussians were slowly advancing upon that city, and the air was continually disturbed by the

vibrations of their cannon. A regiment near which I had remained all day was engaged in skirmishing operations with a French battalion, and from the top of a slight eminence I was endeavouring to make an effective sketch of the scene. Suddenly a white fog rolled over the valley and wrapped both bodies of combatants in its thick folds. I endeavoured to regain my quarters; but the fog increased in density, and I soon found it impossible to make headway against it. For some time I remained motionless. The noise of cannon and musketry died away, and I heard the bugles sounding a retreat on both sides. Then I determined to go slowly back to my quarters near the village of Bonzonville. Unfortunately, I found it impossible to decide which was east and which west. I had been stationed on a round knoll or eminence, and I had walked about its crown so many times during my observations, that I was now unable to decide on the exact spot at which I had ascended it. At last, however, I came to a tree of which I seemed to have some recollection, and I descended the hill and walked, as I thought, towards Bonzonville.

By that time the plain was quiet, and I heard nothing save an occasional far-off bugle note. I walked on for an hour through the thick white fog, seeking for some familiar landmark. None came. I began to realise that I was lost. I stood and wondered what to do. Then I went forward again. A church clock struck the hour, six, close by. Clearly, I was near a village. I came to a road, and hastened along it, and presently fell into the hands of a French picket. I had walked west instead of east. I was at Gravelotte.

The picket marched me into the village, and led me before their colonel, a fierce-looking *militaire*, who glared at me from behind a table at which he was evidently writing despatches. 'What's this?' said he. 'A spy?'

Now, unfortunately for me, I cannot speak French, but my knowledge of German is extensive. I replied to the colonel's question in English. He shook his head. I then spoke in German, and his face grew dark. A soldier interpreted my answer.

'So!' said the colonel. 'A pretty story, indeed! He speaks German like a native, and professes to be an Englishman. Everybody knows that an Englishman can speak no other language than his own. An English artist, eh? See what papers he has.'

I drew all my papers from my breast-pocket voluntarily and handed them over. As ill-luck would have it, I had that morning made a plan of the surrounding country in my sketch-book. The French colonel looked at this narrowly, and nodded his head. 'As I thought,' said he. 'What is this but a map? Come, Mr Spy, what have you to say?'

'Tell the colonel,' said I to the interpreter, 'that I am no spy, but the special war correspondent of a great English newspaper, and that what I said before is true. These are my credentials—bid him look at them.'

The colonel tossed the papers aside contemptuously. 'What of them?' said he. 'They may have been stolen, forged—how do I know? He speaks German—he looks like a German—

he has maps, charts, drawings on him—*enfin*, he is a spy. Take him out and shoot him.'

A corporal tapped me on the shoulder and motioned me towards the door. I was so surprised at the colonel's last words that I stood motionless; but when I realised their full meaning I suddenly found tongue, and rated the whole group in forcible English. The colonel shrugged his shoulders, and repeated his commands, and the file of soldiers began to hustle me out. Before we reached the door, however, he stopped us. 'Spy,' said he, 'we will give you a chance. Tell us all you know of the Prussian movements, and we will consider your case.'

'I shall do no such thing,' said I. 'I am an English gentleman, and I will not do dirty work for either French or Prussian.'

'Take time,' said he. 'Think it over.—*Caporal*, call in a *sous-lieutenant* and two men.'

A young officer and two privates entered the room of the farmhouse in which we were standing and saluted.

'You see this man,' said the old colonel, pointing to me. 'Keep him safe till daybreak; then bring him to me.' He turned to me again: 'Think over my offer, Mr Spy. If you accept it, well; if you don't, you will be shot in the morning.'

The young officer and the two men marched me out into the fog again and took me to a cottage close by. I was placed in a room where a fire burnt on the hearth, and an oil-lamp shed some little light on a plain deal table. My guardians signed to me to sit down; and then one of the soldiers, after a whispered colloquy with the lieutenant, left the cottage, and presently returned with food and drink, which he set before me. Desperately placed as I was, I ate my supper; and when I had finished, filled and lighted my pipe. I thought things over, and could see no chance of escape.

'Monsieur,' said I, addressing the young officer who sat near me on the hearth, 'I shall certainly have to die to-morrow morning, if your colonel persists in his foolish conduct, and I should like to write a last letter to my friends. Will you have the goodness to provide me with writing materials?'

The lad responded in the affirmative, and bade one of his men fetch pen, ink, and paper. While he was gone, the young officer—who was certainly not more than eighteen or nineteen years of age, and had a frank, open face—looked at me curiously, and presently inquired if I was really an Englishman. He spoke English so well that I was surprised.

'Certainly I am,' I answered. 'And anybody but your colonel would have recognised as much. I am an Englishman, and what I represented myself to be when questioned.'

'I am sorry for you, sir,' said he. 'I wish I could help you.'

'Then promise to forward this packet for me,' said I. 'You can show it to your colonel if you like.'

He replied that he would do his best to oblige me; and I set to work at my letter. I wrote out a full account of my afternoon's adventures, and addressed it to the proprietors of my journal. Then I took off my watch and chain and rings

and laid them on the letter, intending to wrap them all up together. I had another ring in my purse, and I drew the latter from my pocket and opened it. As I did so, the bronze medallion escaped and fell from the table to the floor. The young officer stooped, and picking it up, laid it by my hand. The light from the lamp shone full on the inscription. He uttered an exclamation, and picked the medallion up again. I looked at him in astonishment. His face was flushed and eager; he stared at me with wide-open eyes. 'Monsieur!' he gasped—'monsieur! For the love of Heaven, tell me—this medal, where did you get it?'

'The medal?' I said. 'Oh, I got it some years ago in England.'

'But where?' he said. 'Where, monsieur? Ah, do not trifle with me—tell me where. For, see you, monsieur, I am Jules Malan!'

I looked at him wonderingly. This, then, was the Jules over whom the little Frenchman had waxed so eloquent on the racecourse at Doncaster.

'So you are Jules!' I said. 'Then you are the son of the man who gave me that medal?'

'And you are my father's benefactor,' he cried. 'It was you of whom he told us that day when he came home from the race.'

'Well, this is strange!' said I. 'But come, tell me something about your father. Is he back in his native France? Is he well? I have often thought of him.'

'Alas, sir, my dear father is dead, and my mother also. But let me tell you—we prospered in England, for my father had money left soon after your meeting with him, and he secured a free pardon for his political offences, and we returned to Paris. We were very happy, monsieur, until last year, and then my parents died. They never saw me in my uniform,' he added with a sad smile, as he turned the bronze medallion over and over in his fingers. 'Ah, monsieur, how well I remember winning this at the school in your foggy England! My father used often to talk of you and wonder if you preserved his memento. "See, thou, Jules," he would say, "if ever thou shouldst meet my benefactor and canst serve him, do it for my sake." And now I have met you, monsieur, and I would help you—and I cannot.'

'Never mind,' said I; 'perhaps your colonel will see reason in the morning.'

He shook his head at that, and relapsed into silence. For a long time no one spoke. The two soldiers nodded on the long settle; but Jules and I were wide awake. He kept looking wistfully at me: I for my part found it impossible to sleep. Somehow, I could not think the fierce old colonel meant to shoot me, but the mere idea was bad enough to howl over.

Morning came—gray, cold, cheerless. As the bugles sounded outside Jules and his men marched me into the colonel's presence. The old militaire was as stern and unbending as on the night before. He eyed me keenly.

'Well, Mr Spy,' said he, 'do you accept my offer of last night?'

My heart began to thump violently. 'No, sir,' I answered.

'Then you will be shot at once. Lieutenant'—

But Jules suddenly interrupted him. 'No, no, no, my colonel!' he cried, throwing his arms about me. 'No—no—it is my father's benefactor. Behold!'

He held up the bronze medallion. The colonel stared at us as if we had gone mad. 'What's this?' said he. 'Speak, Jules—here is some mystery.'

Jules told the story as only a Frenchman could tell it. When he finished, the old militaire shook my hand, embraced me, and bade me go my way. 'We are not ungrateful, we French,' said he naively.

I said farewell to him and to Jules, and within an hour regained my quarters at Bonzonville.

Well, that is a long time ago, and since then I have often called on Jules Malan and his pretty wife in Paris. We are great friends—for there is a tie between us which nothing can ever break. I shall never forget it, nor will those of my friends who know the history of my carefully treasured bronze medallion.

EXPERTS IN HANDWRITING.

AT the trial of the now partially forgotten miscreant Neill, the blackmailing letters which led to the detection of his crimes were easily identified as his, owing to the handwriting being very peculiar. It might easily have happened, however, as in so many previous cases, that the evidence of an expert would have been required to identify the writer. Such testimony is very frequently given, and is so much a matter of course when any doubt attaches to the authorship of letters, that it is hard to believe that it was ever regarded as inadmissible. Yet such is the case. The reform of legal procedure has gone ahead greatly during the last half-century, and many antiquated and absurd restrictions have been swept away, that with regard to expert evidence among them. It was formerly held that to allow opinions to be expressed as to the authorship of writings would complicate the issues, open the door for invidious selection, and raise points on which an unlettered jury would be incompetent to pronounce. In the Fitzwalter Peerage case, for instance, which was tried in 1843, the evidence of the inspector of franks at the General Post-office was rejected, on the ground that his knowledge of the disputed writings could not have been acquired by acquaintance with the writers, the signatures in question occurring in a family pedigree made in 1751. A similar point was raised before a full bench of the Court of Common Pleas in 1852, and decided in the same sense. It was not until 1854 that a remedy was provided for this very inconvenient state of affairs by a clause in the Criminal Law Procedure Act of that year which permits the judge, if he sees fit, to admit the evidence of experts.

That the innovation was necessary is proved by the fact that the permission has been largely used ever since, and has proved of great service, particularly in cases of forgery. To mention only leading instances: the evidence of experts greatly furthered the ends of justice in the Roupell case,

the famous Tichborne trial, and the Whalley will case of more recent years. This class of testimony is also frequent in County Court actions, where the morals of many of the suitors permit them to have recourse to the most objectionable expedients to gain the day. It is true that specialists in handwriting, like those who devote themselves to medical and scientific subjects, do not always agree, and this renders it necessary to accept their evidence with caution; but the advantage of having points of difference and similarity, which would often escape the notice of the average man, brought clearly to light, is obvious and important. On this point the opinion of the late Lord Chief-justice Cockburn, who tried an unusual number of cases in which expert evidence was introduced, may fitly be quoted. 'The evidence of professional witnesses,' he said on one occasion, 'is to be viewed with some degree of mistrust, for it is generally given with some bias. But within proper limits, it is a very valuable assistance in inquiries of this kind. The advantage is that habits of handwriting as shown in minute points which escape common observation, but are quite observable when pointed out, are detected and disclosed by science, skill, and experience.'

Giving evidence in court is, however, only a comparatively small part of the business of a handwriting expert. His main occupation is advising private persons, especially those who have received anonymous communications. Threatening letters to Irish landlords and others, slanderous post-cards, mysterious epistles signed 'A True Friend'—in fact, all the missives which cowardly, venomous, and illiterate people of a certain class are fond of inditing, bring grist to the expert's mill. The recipient generally has some suspicion as to the origin of these documents, and wishes to have his suspicion either confirmed or set at rest. Valentines, too, furnish a good deal of work, even in these days when they are less popular than they were. During the later part of February there is a plentiful crop of inquiries respecting communications received on the 14th of that month. It may seem strange that any one should spend time and money in ascertaining the source of such banalities, but the undoubted fact that they do is only another illustration of the power of curiosity and the feeling of injured dignity. Besides such applications as we have mentioned, there are many others. Disappointed legatees are apt to have doubts as to the authenticity of a will which has ignored them; holders of dishonoured bills desire to verify the signatures of accepters or endorsers; and autograph hunters are often anxious as to the genuineness of some illegible scrawl reputed to be that of a man of note. In various ways, therefore, the small class of experts—there are said to be only two in the whole of London—find a good deal of employment.

Regarding the methods made use of to determine authorship, specialists are naturally reticent. Some of them have admitted, however, the nature of the leading principles which guide them. The philosophy of the matter rests mainly on the fact that it is very rare for any two persons to write hands similar enough to deceive a careful observer, unless one is imitating the other. 'Fists,' like faces, have all some special idiosyncrasy, and the

imitator has not merely to copy that of some one else, but to disguise his own. By careful and frequent practice he may succeed well enough to deceive the ordinary man, but is rarely successful in baffling the expert. Even the most skilful culprit cannot wholly hide his individuality, as he is sure to relapse into his ordinary method occasionally. Then, again, great care has to be used, and this can be detected by the traces of hesitancy, the substitution of curves for angles, and *vice versa*, which come out very plainly when the writing is examined under the microscope, as it usually is by the expert. A plan of detection which has been adopted with great success is to cut out each letter in a doubtful piece of writing, and paste all the As, Bs, &c., on separate sheets of paper. The process is also gone through with a genuine bit of calligraphy of the imitator or the imitated, as the case may be. Comparison almost invariably shows that the letters are less uniform if imitation has been attempted, the writer being occasionally betrayed into some approach to his ordinary calligraphy, or into momentary forgetfulness of some special point in the handwriting he is simulating. No point is too small to escape an expert's attention. The dotting of *is*, the crossing of *ts*, the curls and flourishes, the intervals between the words, the thinness of the up-stroke, and the thickness of the down-stroke, are all noted and carefully compared. Where only a signature has been forged, and that by means of tracings from the original, the resemblance is often so exact as to deceive even the supposed author, but in these cases the microscope is generally effective in determining not merely the forgery but the method by which it was accomplished. It is some comfort to know that the cunning of the forger is overmatched by the scientific skill of the trained expert.

VISITANTS.

By ARTHUR L. SALMON.

THEY come to me at dawn of day
With whisperings of long ago,
And haunt me in the twilight gray.

With notes of a forgotten lay,
That once so well I used to know,
They come to me at dawn of day;

And when in dusky aisles I pray,
They come on wings of music low,
And haunt me in the twilight gray.

In scented blossoms of the May,
In winds that through my lattice blow,
They come to me at dawn of day.

They come from regions far away,
On summer showers or flakes of snow,
And haunt me in the twilight gray.

Through everything I do or say,
Some tokens of their presence flow;
They come to me at dawn of day,
And haunt me in the twilight gray.

APPEAL CASES IN THE HOUSE OF LORDS.

AN appeal to the House of Lords is essentially and emphatically a last resort on the part of any litigant, and is also highly expensive. Moreover, it must be preceded by a long course of costly litigation in inferior courts, and an absolutely unassessable amount of mental wear-and-tear and of waste of moral tissue. But an explanation of the course of procedure may not come amiss, even to those who have no prospect of being concerned in a case appealed to the Highest Court of Appeal in the United Kingdom.

The first thing which strikes both the Appellant and the curious stranger about the House of Lords is, its utter unlikeness to any court of justice with which he has been familiar. The atmosphere is distinct and peculiar, and as different from a Sheriff Court, or Assize Court, or even the Inner House of the Court of Session, as can well be imagined. The whole area seems bathed in an air of calm repose and cool deliberation. There is no hurry and no excitement—no crowd of anxious witnesses, and no gallery of interested spectators.

If you have lost your case in all the lower courts, and are still convinced, or persuaded, that the law is really on your side—and strict law is the nearest approach to absolute justice we can look for in human society—and decide to appeal to the House of Lords, you find from the very outset that you are to have a wholly new experience. The familiar, if somewhat exasperating, 'Take Notice' of your former proceedings disappears, and you make acquaintance with a document addressed 'To the Right Honourable the House of Lords, the humble petition and appeal' of yourself, praying that the judgment in such-and-such a case be reviewed before Her Majesty the Queen in her High Court of Parliament.

But before even this petition can be lodged, you must obtain two Counsel of standing and repute to certify in formal terms to the Lords that they 'humbly conceive this to be a proper

case to be heard before your Lordships.' This petition must be printed on parchment—a costly item in the luxury of Appeal. With this petition, security has to be lodged for due payment of the costs to be incurred—namely, a 'recognisance' to the amount of five hundred pounds and a bond for two hundred pounds.

Supposing all these preliminaries to be completed, then the case for each side forming the subject-matter of Appeal has to be set forth for My Lords. It must be clearly printed in large type on quarto-sized sheets, and bound in book-form. Forty copies must be lodged, and of these, ten must be bound in purple cloth, with parchment slips inserted at each part of the case, thus dividing the book into sections—namely, 'Petition and Appeal,' 'Appellant's Case,' 'Appellant's Index,' 'Respondent's Case,' and 'Respondent's Index.'

No witnesses are called, of course, in an Appeal to the Lords, and therefore there is no cross-examination, no browbeating, and no sparring between Counsel. The facts are supposed to have been already thoroughly thrashed out, and it remains but to deliver the final and irrevocable fiat of the law upon the law of the case.

The ultimate arbiters who constitute this Supreme Court of Appeal are, nominally, all the Peers of the realm. Every Peer, of whatever rank, is entitled to sit and hear arguments in any case. But in practice the lay Peers, as distinguished from the legal Peers, do not attend, and they never attempt to exercise their constitutional right. The judges who actually constitute the House of Lords as a legal tribunal are—the Lord Chancellor, the Lords of Appeal-in-Ordinary—who are life Peers created for this special purpose—and such other members of the House of Lords as have held high judicial posts in the past—ex-Lord Chancellors and the like. Three such Peers are required to form a quorum, no matter how many lay Peers may choose to attend at the hearing or voting. In practice, though not by statute, both the hearing and the verdict are left entirely to the Law Lords.

During the hearing, the Lord Chancellor in his robes comes down from the woolsack and takes a seat along with his legal colleagues on the benches nearest to the bar, on the other side of which is accommodation for ten or a dozen Counsel and legal agents. Before each of the Lords is placed a small movable table to hold his papers and books of reference, &c. And then the business begins. But it is conducted in a very different manner from the proceedings of which you have had unhappy experience in the courts below. Here are no flurried witnesses, excited agents, anxious 'parties,' and dictatorial barristers.

The facts are before the House, in clear print and compact and condensed form. The Counsel for the Appellant proceeds to argue against the judgment of the lower court in the light of the facts and on points of law. But he does not orate, and argument takes rather the form of friendly debate in ordinary conversational tones. There is no hurry; and as points are raised and cases are cited, the attendants are engaged in bringing books of reference, &c., so that the Lords may verify quotations or refresh their memories. Now and again a Peer puts a quiet question, which either throws a new light or leads to fresh inquiry. Everything proceeds with calm and dignified pace, and for an example of patient, dispassionate perseverance there is nothing to excel the House of Lords sitting as a Court of Appeal.

When the Counsel for the Appellant has stated his case, and the Counsel for the Respondent has, in the same conversational manner, replied; when the Lords have heard both sides with equal patience, and have elicited all the information they require to form a judgment on the various points presented, then the House adjourns, and the time comes for you to exercise patience. For when judgment will be delivered no man can say. The Peers require time for consideration, and the law must not be jostled.

At last, however, you hear from your agent that your case is on the paper for to-morrow's business, the House sitting at 10.30 A.M. Down you go to Westminster, and find yourself in the lobby, perhaps, with a small crowd of other anxious and excited Appellants and Respondents, whose cases are also down on the paper for judgment. Here also come the gentlemen in wigs and robes, who, being professionally engaged, may enter the sacred precincts by the big doors; while their brethren, equally learned in the law, but not at the moment professionally engaged, must wait their opportunity like ordinary civilians.

We will assume that you have obtained entry to hear what is officially called the 'Consideration' of your case. You find the appearance of the House somewhat different from what it was during debate. The Lord Chancellor is on the woolsack; and other four Peers, say, are on the benches near the bar, two on each side, and each with the little table again before him. Perfect silence reigns, and calm and deep peace pervade the atmosphere—whatever may be the turmoil in your own bosom.

By-and-by the Lord Chancellor rises from the woolsack, and, with slow and deliberate pace, descends to the clerk's table. Standing at the table, he begins to read from his manuscript:

'My Lords—in this case of *A. versus B.*'—and so on to the deliverance of his own opinion on the points. Then he returns to the woolsack, and a Law Lord rises and reads his opinion, perhaps at some length, but with clearness and argumentative force. Then rise in succession the other Law Lords, each not delivering but reading his opinion, some giving reasons at length, and some, perhaps, merely concurring in a few words with opinions already read.

Some Law Lords are habitually minute and painstaking in setting forth their reasons for arriving at conclusions, and in marshalling the arguments by which they fortify their reasons; but other Law Lords are as habitually terse and reticent, frequently concurring without stating either reasons or argument.

This, however, is the rule of the House, as fixed and immutable as the laws of the Medes and Persians: that each Peer must read, not recite, his judgment from his own written or printed text, and he must read it standing, as if he were addressing the whole House, and not a long array of empty benches.

When all the Law Lords have finished reading their opinions, you realise, let us say, that they are unanimously in favour of the decision of the court below—which means the dismissal of your Appeal. This being so, the Lord Chancellor rises, but remaining by the woolsack, and turning towards right and left, as if the silent benches were peopled with listening Peers, thus pronounces, without pause or punctuation: 'My Lords, the motion before your Lordships' House is, that this Appeal be dismissed. Contents? Non-contents? The Contents have it. The judgment of the House is that this Appeal be dismissed, and that the Appellant do pay to the Respondent the costs of this Appeal.'

And all is over. Nothing remains for you but to pay the piper. The end is final, and you have only the consolation of reflecting that the highest legal luminaries in the world have, in the most impartial and dispassionate tribunal ever constituted, regarding your case in the light of strict law, and on principles of pure justice—decided that you are in the wrong. It has been a costly experience, but finality is not to be bought cheaply.

POMONA.*

CHAPTER XX.

Oh, see ye not that bonnie road
That winds about the fernie brae?
That is the road to fair Elfland,
Where thou and I this night must gae.

THOMAS THE RHYMER.

It is three months since Pomona's birthday, and August is brooding hotly over the land, blazing on the poppies and the dusty roads, and throwing great heavy elm-tree shadows on the meadows, and setting the air quivering over the stubble-fields. Those three months have not been unmixed happiness to either Pomona or Sage; what fortunate mortal ever had three months' happiness unmixed?

* Copyright reserved in the United States of America.

Lady Lester's life was ebbing gradually away ; and after another fortnight of trying to keep up the delusion that she would be better soon, and the pitiful pretence that Pomona was enjoying the season, with all the time an aching heart of anxiety, to be kept hidden like the Spartan boy's fox, though it drove with her in the park, was her partner at all the balls, curtsied with her at the drawing-room, jarred with its sad voice on the gay music of opera or concert, the girl was allowed to go down to Beechfield to share with the devoted maid the infinitely sweet, sad duty of caring for her mother's weakness and soothing her weariness.

'I have never had you so much to myself before, Mona,' Lady Lester would say ; and the girl would hardly be persuaded to leave her room or to move out of reach of her hand.

'Why should I not have been always with you like this ?' she used to protest, wondering at the tyrannical yoke under which we wilfully place our necks, filling up our life, short as it is, with a useless, wearisome routine, that is no pleasure or profit to ourselves or any one else, crowding out our real heart's happiness.

Now and then Lady Lester was well enough to be carried down-stairs, and just once or twice to be drawn in her chair along the terrace, and to stop for half an hour under the great fragrant branches of the cedar, looking with dreamy, far-away eyes at the sunny park, which had a strange unfamiliar look, as familiar things often have to dying eyes, perhaps from looking beyond them to the better country.

That coincidence of Maurice's calling the day Sage was at Beechwood was not anything very remarkable after all, except in Sage not knowing of his being in the neighbourhood, and even that was merely from her failing to realise that Crowcombe Rectory, where Maurice's old uncle lived, was within a drive of Beechfield, and that he and his wife and Lady Lester had known each other for many years. Why, even Pomona had found out that Maurice was related to their old neighbour at Crowcombe, and that, though he had not been there since he was a child, he was not unlikely to be staying there soon, so that it was no great surprise to her to see his card with those of Mr and Mrs Irby.

Since that first meeting with Maurice at Mrs Copleston's, she had met him repeatedly in that curious way in which, in the stir-about of life, two atoms that have never met before, once brought together, are continually jostling one another in a manner most incomprehensible considering the many millions of atoms concerned. After the first it was not, of course, always accidental that Maurice should be in the park at the time Pomona took her early ride ; and after a chance encounter, when Maurice was calling one afternoon at the same time as Pomona at Mrs Copleston's, that lady gave a helping hand, and took Maurice with her to several houses where she knew Miss Lester was to be met.

And now, by some strange caprice of Dame Fortune, who, like other ladies, appears sometimes the most openly manœuvring of matchmakers, these two were taken out of the gay throng, where Pomona would have been so surrounded by admirers that Maurice would have hardly had a chance to come near her, and sent off, as

it were, to the conservatory, or to sit out on the stairs through ever so many dances, they two by themselves. Pomona, to be sure, was nursing her mother, and Maurice was helping his uncle in some business of a tiresome, pottering description, that at once worried and interested, irritated and amused, the old man. But Crowcombe Rectory and Beechfield are only three miles apart, and Mr Irby often wanted to hear how Lady Lester was ; and when Pomona went for her daily walk or ride, on which Lady Lester insisted, what more natural than that those two should meet under the midsummer trees, or in the deep, ferny lanes, or by the lake ?

I do not think either Maurice or Pomona realised whither they were drifting during those midsummer days. With Pomona it was part of the strange, unreal life she was leading ; ordinary conventional life seemed to be set aside ; society and all its works were at a distance ; she wore the same cotton frock all day long ; there was no grand dinner spread at eight o'clock, but a tray brought up into the old schoolroom any time she pleased ; and so there seemed nothing out of the way in her daily meetings with Maurice, and the intimacy that those daily meetings brought about.

I am quite sure that at first Maurice had no intention of disloyalty to Sage. It cannot be held disloyal to dream wild, impossible lovely dreams ; who can help their dreams ? Nor can it be held disloyal in a poet or painter to draw in words or pigments beauty other than that of his own liege lady. Those days were a long intoxicating dream to Maurice, full of a fascination from which there was no escape, even if escape had been desired ; they were a poem of sweetest melody, a picture in which he and Pomona were represented as they were in *Lowlow's* picture.

It was always now 'poor, little Sage,' when he thought of her, for he did think of her, and wrote too, and more frequently and more tenderly than heretofore. Poor, little Sage ! I am afraid, when that feeling of pity begins to creep in, the love is a little on the wane, pity being only akin to love, not by any means the same.

When Maurice and Sage met in London, the day following that on which Sage went to Beechfield, there was much to hear and explain on both sides. Sage found a much more sympathetic listener in him, when she expatiated on Pomona's perfections, than she did in her father. But then, of course, Dr Merridew had not seen her, so could not be expected to understand the charm ; and Mr Ludlow's want of appreciation was one of those unaccountable perversities that the most excellent men are subject to. But Maurice agreed with all she said about Pomona in a quite satisfactory way, not too heartily, which is a very mistaken form of agreement, and apt to modify the unlimited praise which might otherwise be bestowed on the object under discussion.

But Maurice did not originate much in Pomona's praise, only echoed, sometimes even with a slight qualification, what Sage said of her, and left Sage with the impression that he would soon admire Pomona almost as much as she did herself, and that she had drawn his attention to several points he had not discovered for himself, though he quite appreciated them.

'And, Maurice,' Sage said, 'I want you to promise that you will not tell Pomona anything

about our engagement—indeed, you had better not talk to her about me, or it might slip out without your meaning it. I have quite set my heart on telling her myself, and I wonder why I have never told her already, for she is so sympathetic and nice. Do you know, Maurice, I was very near telling my aunt, Lady Lester, all about you, for she guessed, I don't know how, that there was some one I cared for; and she asked if you were very nice, very tender, very true, as if she almost knew all about you already. When I go down again, I will tell her.'

But Sage did not go down again, nor did she see Pomona during the fortnight she remained in London except dressed to go to the drawing-room, a lovely scene of satin and billowy tulle and ostrich feathers and diamond stars, too exquisite to be approached except at a very respectful distance, and too far off for any confidences to be possible.

Kitty was never tired of hearing that wonderful dress described, and after a few repetitions, Sage found herself making little additions, to heighten the effect. Kitty required a good deal of amusement and humouring in those days, for the headache and loss of appetite had not been so entirely mythical, and Sage found a very feverish, tossing, little person in bed when she came home from Beechfield.

'Maurice must not come,' was Sage's first thought; and Dr Merrieworth shrugged his shoulders, and wondered if smallpox or the plague would have kept him away from Sage's mother; and Sage, keen in defence of her hero, read the thought, and protested. 'Of course he will want to come; but it's for my own sake I'm going to ask him to stop away. It will make me so anxious and bother me, if he comes; and I don't want to think of anything but little Kit.'

And so she wrote an imperative, little note, smelling strongly of carbolic, and had to write it over again because a sudden tear splashed down unexpectedly on the paper at the thought of how, if she took the fever and died, she would entreat, with her dying breath, that Maurice might not be told, lest he should run the risk of infection.

Of course, that peremptory note had the immediately opposite effect of bringing Maurice to Dalston, as, deep in her deceptive little heart, Sage knew it would do, though she scolded him with tears of loving pride in her eyes for his rashness and disregard of her wishes; and she made such a glorification of his courage and self-devotion all the rest of the day, that Dr Merrieworth could not resist observing that a doctor did as much and a great deal more every day of his life and thought nothing of it.

'But you will not come again, dear,' she pleaded; 'promise me you will not come. I shall really, really be happier if you don't; and I shall be so busy, too, nursing Kitty, it will take up every moment of my time. I will send you a line every day to say how she is; and if you will write sometimes, it will be better even than seeing you, for I shall not feel anxious about you.'

Kitty was too ill during the days that followed to allow time for much thought, even of Maurice, in her anxious little nurse; and when the worst was over and Kitty, grown and long-legged and large-eyed, was creeping back to life, Maurice was called away again down to Crowcombe, to

help Mr Irby in that business to which reference has been made, and which brought him again in contact with Pomona, who had gone down to Beechfield a few days previously.

'Have you seen Pomona?' Sage asked in nearly all her letters. 'Have you been to Beechfield? Have you heard how Lady Lester is?'

And sometimes in his reply Maurice would mention that he had met Miss Lester, who looked well; or that his aunt had driven over to ask for Lady Lester, who was rather better; but he did not think it necessary—and why should he?—to recount how these meetings with Pomona were almost of daily occurrence. Nor did he relate how one afternoon, when he had called to inquire, Lady Lester had been on the terrace, and by some strange caprice, seeing that she had not seen any of her most intimate friends for weeks, expressed a wish to see him. He had sat for a few minutes on the stone balustrade by the side of her chair, under the great dark cedar at the end of the terrace, and she had smiled at him with the wan loveliness over which the cold shadow of death seemed already falling. He had helped to move her chair when she was tired and wanted to go in; and he had done it so gently and skilfully, that she had thanked him, and said she had never crossed the terrace with so little shaking. As she bade him good-bye, she smiled at him with a kindness out of proportion to the small service he had done her; and with a sudden impulse, he stooped and kissed the transparent hand that lay in his, and turned away with a strangely beating heart and unaccountable agitation, feeling as if, without a word, some understanding had been come to between them, some trust had been conferred and accepted; and meeting Pomona coming in from the terrace with a shawl that had been dropped, he took it almost authoritatively out of her hand, as if he had a right to care for her.

He went back to Crowcombe that evening more in a dream than ever, spell-bound by the magic of the great enchantress, love, with whose power he had often played, and whose growing bonds he had lightly twisted about him, conscious that at any moment he could break loose from them, like Samson from the Philistines' new cords. But now, like Samson shorn of his strength, he could no longer go out as before and shake himself free.

Mr Irby won every game of backgammon that evening, which was a great gratification to the old man, till he began to suspect that Maurice was not paying any attention to the game, which robbed his triumph of half its splendour; and his gentle old wife had to intervene with the bedroom candles to prevent an outburst of irritability.

'It was my fault, Richard, for I quite forgot to give him the letter that came by the second post, and I expect his thoughts were with his young lady in London.'

Oh! poor little Sage, I wish it had been so!

CHAPTER XXI.

Our eyes see all around in gloom or glow—
Hues of their own, fresh borrow'd from the heart.

KEBLE.

'DEAR LUDLOW—Thank you very much for your proposal that Kitty should come and recruit at Scar. She does not pick up so quickly as I should like and expected; and Sage, too, is not up to the mark, overdone a bit with the nursing and

anxiety about Kitty, though she declares she is all right; and I think sea-air will do them both good. The boys are going with their cousins to Broadstairs; so I will pack off the two girls to you the beginning of the week, and thank you heartily for the invitation.—Yours sincerely,
JOHN MERRIDEW.

There is a legend that ladies always put the most important part of their letter in the post-script, and I think men sometimes do the same, for in this instance Dr Merridew added: 'Do you hear anything of your young friend, Moore?'

Back again at Scar! Both Sage and Kitty would have declared any time since they left it, last September, that it was the one thing of all others they desired.

There was little alteration at Scar Farm since last year, except that Mrs Stock came out to meet them with a widow's cap surrounding her kind little face; and Job's coat no longer hung on the kitchen door, or his pipe on the mantel-piece, and all the bedrooms were adorned with a black-framed funeral card with a weeping willow and an urn, and a long inscription in the farmer's praise. Otherwise, the death of the master made little difference in the house or in the farm either, where, as a matter of fact, Mrs Stock had done most of the business for years past.

The studio was in no way altered; and in the bow window was spread just such another attractive-looking tea as had so often invited the attention of the Merridews' healthy appetites, but which now had no charms for poor Kitty, and to which also Sage could not attend till she had got her patient safely to bed. Even then, she sat longer than was necessary by Kitty's bedside, with an unusual shrinking from a *tête-à-tête* with her friend; and she had half a mind to ask Mrs Stock to bring her some supper up-stairs, and tell Mr Ludlow she did not like to leave Kitty. But it must be done sooner or later, and she might as well to-day as to-morrow face the inevitable question: 'Well, how is Maurice? When did you hear from him last?'

But after all, she had not to answer that question, for Mr Ludlow did not mention Maurice till tea was done, and then he said: 'I heard from Maurice this morning. I asked him to come down for a bit while you are here; and he hopes to do so.'

Just think what this silly little Sage would have missed if she had decided not to come down. She would have missed a beautiful, beautiful evening, with a sunset as heavenly as any of last year's, even that at the Landslip; the exquisite delight of seeing it all again unchanged, of meeting the old friends, of passing down the village street and getting a greeting from almost every door; finding her way to the beach, and seeing the grand old Scar Head growing dusky against the orange sky, just as it did that evening when some one had come out of the very sunset.

'Why, Sage,' Ludlow said, 'I do believe Scar air has done you good already. You don't look the same girl I met just now at Shingle Station.'

And she answered with a laugh of great happiness: 'I don't feel the same.' But she did not go on to explain that those few words of his

about Maurice had worked the cure, brought the light into her eyes and the colour into her cheeks, painted the sunset with more vivid crimson and gold, cast a glory over the sea, put a music into the gruff greetings, a sweetness into the air, and an additional grandeur to the rugged old cliff.

Sage felt a wild exuberance of spirits, which was hardly natural to her, being generally of a placid, undemonstrative nature, and enjoying things quietly; but this was the result of a sudden rebound from the depression that had been growing on her for the last month. It was all very well for her to go on telling herself over and over again that everything was quite as it should be; that she would much rather Maurice kept quite clear of all risk of infection, and that he only did so because she had so earnestly implored him. She could not help now and then putting herself in his place, and wondering if commands or entreaties or even threats would have kept her away if he had been breathing infected air? Of course he was away from London; but sometimes, when she could not sleep, and the nights were hot and breathless, and Kitty was restless and fretful, and the inexhaustible patience of the tender little nurse was sorely tried, she would have a slight rebellious swelling at the heart, with the thought of what a short journey it was up from Crowcombe, and of how soothing it would be to an aching head to rest for a minute or two on his shoulder. His letters, too, had been less frequent of late, which was another thing she severely contested with herself that she much preferred; she would not for worlds that he should feel obliged to write; and yet—and yet—if only he had known how, after one of those bad nights with Kitty, which invariably were followed by a day of great prostration, the sight of a letter on the table made life easier, and hope and cheerfulness more possible, he would have been glad to write constantly.

He sent her a box of flowers now and then, the kindness of which she exaggerated, poor little soul, to something quite heroic, though, man-like, he packed them so badly, usually also selecting geraniums for the purpose, that they were all knocked to pieces in the post, and presented a poor appearance when taken out by her grateful fingers.

When the idea of going to Scar was first mooted, Sage was quite sure that Maurice would come up to see her before they started, even if he did not travel down with them. But he only wrote to say how glad he was they were going down to Scar, and that he hoped the sea-breezes would soon set Kitty up again. He had not said a word about there being any chance of his coming to Scar, but that, Sage told herself now, was just like him, so that it should be a delightful surprise to her. And this also accounted for his not coming up before she left London, as, of course, they would meet so soon that it was not worth while.

Oh, the difference the prospect of his coming made in everything! Little Scar and the great cliff beyond and the wide sea and the sunset sky need have felt no vanity from Sage's rapturously expressed admiration, for I have an impression that Dalston, frowzy, dusty, and fatigued, would have looked quite as beautiful to her if she had

expected to see Maurice Moore walking up the street.

Owen Ludlow noticed the change in her with great content, and as he sat on the great rock by her side and heard her gay young voice chattering on with more life and merriment in its tones than was usual to it, he felt greatly relieved and reassured that it was only fatigue and anxiety about Kitty that had made her look so white and large-eyed and out of spirits when she first arrived.

'I must have as much of you as I can, little Sage,' he said, as they slowly climbed the steep little street where lights twinkled out from small windows and open doors at which stood groups of men who bade them a gruff good-night. 'I must have as much of you as I can; for when Maurice comes, he will monopolise my little friend, I expect, and I shall be left in the lurch.'

And Sage laughed a happy little laugh, and passed her hand coaxingly under Ludlow's arm. It was so pleasant once more to have it taken for granted that Maurice would want to monopolise her; there had been very little symptom of such a desire of late.

'When will he come?'

'Oh, very soon, very soon,' the painter said, pressing the little hand against his side. 'I'll wager that I shan't be allowed more than a day or two of my little friend's company.'

And Sage went up to bed with those words 'Very soon, very soon,' ringing in her ears, keeping time to her footsteps, that were fain to dance for very happiness on the creaking boards of the farmhouse staircase.

LEATHERN WINGS.

By FRANK FINN, F.Z.S.

IN marvelling at the strange forms of extinct animals which science is constantly bringing before us, we are apt to forget that many living creatures are quite as wonderful as those which have passed away. Those weird winged reptiles, the Pterodactyls, for instance, are not more strangely removed in structure and habits from their reptilian relations than are the modern bats from other beasts. In all essential points near relatives of such humble earth-dwellers as the hedgehog, mole, and shrew, the bats are nevertheless far the most aerial of vertebrate animals at the present day. Not one of them is as well fitted for walking as for flight; the membrane which joins the long fingers, leaving only the thumb free, extends down the animal's sides to his ankles and between the legs, so distorting those members that 'in their owner's ungraceful hobble on the ground his knees stick upwards and outwards. Thus, though he is more at ease when climbing, and can suspend himself comfortably by either thumb- or toe-nails, the greater part of the bat's waking life is spent on the wing. In the air he is most at home, and displays powers of flight far greater than those of most birds. He may not have the speed and endurance of some of the feathered folk; but for facility of evolution in a confined space he would be difficult to rival, as any one will admit who has had a bat-hunt in a room.

Two experiences of my own rise vividly before

me as I write. In the first instance, the bat was a 'flying-fox' of about the size of a pigeon, which one night entered my bedroom in a Zanzibar hotel. Becoming conscious in the darkness that some flying creature was passing and repassing over my head, I got out of bed and lighted the lamp, and found my visitor performing the circuit of the room with a steady even flight, very different from the fluttering progress of our own little species. He will soon get tired of that, I thought; and closing the windows, sat down to wait till he should be wearied, and allow me to capture him for the Zoo at home. Several minutes passed, and I began to think more active measures necessary, as he showed no signs of sinking exhausted; so, seizing a mosquito net, I started on an impromptu fox-hunt. I don't know how long it lasted, but the quarry put the light out twice by his flapping pinions, showed most disconcerting agility in rising from the floor and unhitching himself from the wall, when he was brought down or settled to rest, and finally escaped through a crevice in the party-wall which separated me from a passage with an open window. Whereon I sought again my virtuous couch, vexed and perspiring, but with a greatly increased respect for a bat's power of wing.

My next bat-fowling experience was a rather different one, though the result was the same. The species in this case was our English long-eared bat, and the scene of the hunt a room in a laboratory, whither I had gone with a friend to work at night. Wishing to examine the little creature alive, and then release it, we pursued it with dusters for about an hour. At the end of that time, as we were far more exhausted than the bat, and had lodged most of the dusters on the top of a high cupboard, it occurred to my companion that he did not want to catch the poor thing, and we opened the window and left it to its own devices.

In addition to displaying such activity on the wing, bats have considerable power of extended flight, the Indian flying-fox having been known to board a ship two hundred miles from land; and they are found, with birds, on very small and remote oceanic islands. These they must have reached by fair flight, unless they had the good fortune to meet with a floating log; for, though a bat swims well, it would probably find much difficulty in rising from the water, did it settle to rest, as many birds are known to do.

Yet, though the bat has so well won its way to what is popularly supposed to be the realm of the birds, it has not received much favourable recognition from humanity, which lavishes adulation on the undeserving. For 'the light-minded fowl,' as a Greek dramatist calls them, treat their gift of wings with a sad lack of appreciation. Let a bird get on an oceanic island free from terrestrial foes, and unless it is obliged to fly for its food, it proceeds to wax fat and lazy, and in the end loses its power of flight altogether. It finds out the short-sightedness of this policy when, in after-ages, man arrives at that island. But that is by the way.

The bat's weakness, however, as well as its strength, lies in its wings. If the delicate finger-bones, which stretch the membrane like umbrella-ribs, or the membrane itself, be damaged, the

animal is disabled. Indeed, a method of capturing bats practised by the inhabitants of some of the South Sea islands shows that the wily savage has appreciated this. Armed with a thorny bush on the end of a long bamboo, he stealthily approaches a flying-fox which has settled to feed on a fruit-tree, when a dexterous blow will tear the bat's skinny wing and bring it to the ground; an acceptable addition to the hunter's commissariat. The flying-foxes are relished as food by the inhabitants of the countries where they are found; and certainly a creature which lives on fruit ought to be good eating. Their heads are wonderfully like that of a miniature fox; and their large eyes suggest that they find their way by sight, of which sense the small insectivorous bats would seem to be almost independent, as blinded specimens, in the experiments of Spallanzani, proved to be able to avoid obstacles to their flight as easily as those which could see. This power bats owe to their highly developed sense of touch, the large sensitive surface offered to the atmosphere by the broad naked wings enabling them to perceive an object before they touch it, probably by the difference in the resistance of the air. And the huge ears and complicated nose-appendages found in so many insectivorous species also subserve the purpose of guidance, though they certainly do not add to the animal's appearance, the facial aspect of some bats being past description hideous, while they are just as offensive to the nose as to the eye. One very ugly naked species exhales so detestable a perfume from a pouch under its chin, that an artist who was taking the portrait of one of these delectable animals was almost made sick by the stench. One cannot wonder that the attributes of the blood-sucking vampire have been wrongly given to several hideous American bats, especially to that species named 'Vampyrus spectrum,' from a mistaken notion, indeed, since it is frugivorous. There being no flying-foxes in the New World, some of the insect-eaters have adapted themselves to a fruit diet.

Nevertheless, two species have been proved to suck the blood of other animals, though these are not nearly so ill-looking as some of their harmless relations. And in the Old World there are bats which prey on the smaller members of their own family, and on other creatures that they can catch, such as birds and frogs. Considering the general attributes of the bat-kind, it is not to be wondered at that mankind should have borrowed their claws and angular wings wherewith to garnish those grotesque creations of the imagination known as dragons. It is true that it has been suggested that the Pterodactyls gave the first idea of dragons to humanity; but this is unlikely. In the first place, several geological periods intervene between the last Pterodactyl and the first man; and in the second place, the artistic mind notoriously revels in the production of monsters whereof it may be just as safely affirmed that they never could have existed, as that they never did. It has given the 'worm' of our ancestors a rhinocerotid head, birds' feet, and an incandescent breath—why, therefore, should it flee to fossils for the paltry detail of wings, when the bat was close at hand to supply them?

Nevertheless, it must be admitted that the Pterodactyls were somewhat dragon-like, especi-

ally the larger species; for though most were of moderate size, not exceeding that of a crow or a flying-fox, and some, even, no larger than sparrows, yet the largest attained a spread of wing of more than four fathoms. These wings, though like those of the bats in being expansions of the skin extending to the limbs, differed from them somewhat in detail. In the bat we have a free thumb and four immensely lengthened fingers; in the Pterodactyl the fingers were free from the wing membrane, except that corresponding to our little finger. This in the volant reptile was the largest of all, a long, tapering, jointed rod of bone, and the main support of the wing, which was a long and narrow one, something like that of a swallow in outline. As the Pterodactyl's hind-limbs, like those of the bat, are weak and more or less involved in the wing-membrane, it is extremely unlikely that it could sit up and perch or walk like a bird, as some have suggested; its terrestrial or arboreal promenades, therefore, more probably took the form of a bat-like crawl on all-fours. Its head, however, was more like a bird's than a bat's, having a long snout, armed with teeth or a beak, or both, and large eyes. Feeding on insects, and probably also on fish, the Pterodactyls must have borne some resemblance, when on the wing, to the terns or sea-swallows of our own day, with their large heads and long narrow wings. Whether, as they wheeled and swooped over a shoal of fish driven to the surface of the sea by the rush of the great reptilian whales of the period, they indulged in the vocal performances of the modern sea-bird, is of course only a matter for speculation. Probably they were more gifted with voice than our modern reptiles. And these are not entirely dumb, as the bellowing alligator and chattering house-lizard prove; while, on the other hand, some birds have got no further than the well-known reptilian hiss. To talk of the colours of Pterodactyls may also seem to recall the method of the German scientist who, in the solitude of his study, evolved the camel out of his inner consciousness; yet we constantly find that the more aerial creatures are the more brightly decorated; the little 'flying-dragons' of the present day, lizards whose long movable ribs support a skinny parachute, are as gaily coloured as butterflies, while even their terrestrial relatives are often exceedingly beautiful. So that it is more than possible that some at least of the Pterodactyls, like Mr Oscar Wilde's dove, rejoiced in 'silvered wing and amethystine throat.'

Speculation fails us somewhat, however, when we begin to inquire into the origin of these old pliers of leathern pinions. The links which bind these strange creatures to other reptiles are wanting. And, curiously enough, as far as fossils go, the case is similar with the bats; for all fossil bats are just as truly bats as are the living species. Fortunately, however, there exists a 'living fossil,' which, though it could not have been the ancestor of these flying beasts, yet very clearly points out the way in which such anomalous creatures might be developed. This is the Galeopithecus of the East Indies, a creature which is neither cat nor bat nor lemur, and yet has been at different times called by all these names, and finally herded with the mole and shrew tribe, mainly because it will not fit in anywhere else. It is a tree-climber, and apparently a vegetable feeder, and is one of

those creatures which fly by a parachute formed by a flap of skin along the sides, extended by the limbs; the most perfect of parachutists, for this web extends between the hind-legs and between the toes, enabling the animal to glide as far as seventy yards at a time. Besides some points in its internal anatomy, the webbed hind-feet forbid us to regard the 'cat-monkey' as a surviving incipient bat; but, nevertheless, from some form very much like it we may easily imagine that the present rivals of the birds were developed. That leather will ever surpass feathers as a material for wings is very unlikely; the Pterodactyls, though in the height of their power when the birds began in the feeble-winged, half-reptilian Archæopteryx, have yet entirely died out ages ago, without leaving any descendants. Skin-winged reptiles had reached their highest perfection, and a different stock supplanted them, which flew by feathers. One reason of this may have been that a feather-wing is so much less liable to irreparable injury than one of membrane; and the Pterodactyl's wing, stretched on a single support, must have been thrown out of gear even more easily than a bat's. Were not birds essentially creatures of the day, for true night-fliers are few among them in proportion to the many that love the light, it is possible that the bats themselves might never have conquered their present share of the empire of the air.

LESS THAN KIN.

CHAPTER II.

TWENTY years bring changes into all lives, and those of Mildred and Charles Russell were not likely to be exempt from the universal law. The vicarage of Denleigh, which had been their home for all that time, had been the scene of both births and deaths; and by the time that their eldest son was twenty-five, and Ena a pretty, gray-eyed damsel of twenty, there was but one other child, Bijou, a fragile, petulant, self-willed, little mortal of twelve, left to share with the other two their parents' love. For that she had not an equal claim with Dick to talk of 'father and mother,' Ena never dreamt.

The immediate removal of the family from the Hampshire curacy to the Yorkshire town had of course made the keeping of Jack's secret a comparatively easy matter; the more so since, from the day he received it until the present, Sir George Daintry had deigned to take no notice of the letter which gave him information as to the existence and present position of his grandchild. So Ena had grown up exactly as her father desired, regarding herself as the eldest daughter of the house, and claiming as her right the affection which she most fully returned. Never for one moment had either husband or wife regretted the adoption of the baby, who had won for herself so warm a corner in their hearts.

As to Dick, before he left home, four years ago, he had believed that the world contained no one so bright and helpful and lovely as his sister Ena. In which, of course, he was mistaken. But his was a pardonable error, and one to be rather cultivated than discouraged on the part of brothers as a race.*

Except for the loss of the little ones, upon whose waxen faces hot tears had fallen, and each of whom existed still as a memory in at least two hearts, poverty had been the one trouble that had fallen upon the vicarage. The small private means which had emboldened Mr Russell to accept his present incumbency had some time ago been swallowed up in the failure of a bank. Happily, Dick had then just completed his university course, and was already looking out for a tutorship, which might tide over the period that must elapse before he should be of age to follow in his father's footsteps and take Holy Orders. And upon the very morning that brought tidings of the crash, there came also a definite offer of a post, with a salary so tempting that, under the circumstances, it could not be refused; even although the condition attached to it—that he must undertake not to leave his pupil until the boy of thirteen should have passed his seventeenth birthday—must have the effect of delaying Dick's own ordination.

The lad of whom he thus received the charge was extremely delicate, requiring constant change of air and scene, always away from England. Therefore their long companionship, now drawing to a close, had been spent by both pupil and tutor in almost incessant travelling, which had never once brought them within sight of home. And at the present moment, when Dick's long-desired return was actually approaching, there was much anticipation and counting of days in Denleigh vicarage.*

'No letter this morning from him,' remarked Ena, standing, tall and slim, beside the already deserted breakfast table, and turning over the small pile of recently arrived correspondence.

'I daresay that Frank Roberts has taken him off on a fresh wildgoose chase to the other end of the world,' grumbled Bijou, of the long lashes, and—truth to tell—rather vain air. 'Dick isn't free for three weeks yet, remember, and that boy will have his pound of flesh!'

'What an unpleasant comparison,' remarked her father, who had just entered; 'and specially in regard to Frank Roberts, who really has been as good as gold to Dick.—Milly, my dear, apropos of gold, pray, where did you put that money that I left on my study table yesterday morning?—And, Ena, will you get out my thin overcoat? Really it is too warm for the thick one, now that May is in.'

'Shall I put away the other, dad?'

'No. I've hung it in my wardrobe, and let it stay there. I may use it once or twice at night even yet.—But about the money, Mildred?'

'I didn't see any, Charlie. I wish I had!' with just her old, merry laugh. 'How much and what was it for?—Don't look so bothered, old fellow.'

'But really I *am* bothered. It was too large a sum to lose, dear. Wakelin brought it yesterday for the pupil-teachers' salaries, and that I might get rid of the National Society's account. There was over twenty pounds. I must have left it on my table, when I was called away to baptise Mrs Brown's child. I paid Clarke on my way home, I remember.'

Mildred nodded. Clearly, she understood all about Clarke.

'When I returned, the other matter had escaped my memory completely. The money must have gone though, during my absence, or the sight of such a pile would have reminded me. I never thought of it again until I wanted to take it down to the schools, and then it had vanished. Only I made sure that you had it.'

'Not I!—But you've dropped it inside a drawer or somewhere. I'll come and help you to hunt.' With which she slipped her arm through his, and rubbing her head caressingly against his shoulder, looked up into his worried countenance with a smile. If any one could, chase away gloominess from that face, where of late years clouds were apt sometimes to gather too quickly, it was certainly Mildred; just as surely as Charles was her consoler in those moments of weariness and depression which fall to the lot of high-spirited beings like herself.

'It will be in the middle drawer, at the top of everything. Now see if I am not right!' she told him cheerily.

But the prophecy unfortunately proved a false one. And even Mrs Russell began to look grave when, after emptying every familiar receptacle and customary hiding-place, she had to acknowledge that if her husband had, in a fit of abstraction, deposited the money in some safe corner, he must have taken remarkable pains in making a selection.

'I wouldn't care so much if Wakelin hadn't had a hand in it. But he is always so particularly unpleasant to deal with.'

'Not much worse than some of the rest,' responded Mrs Russell. For the south-country-bred folk had never grown accustomed to their north-country parishioners, with whom, on their side, neither of the pair were favourites. And the constant intercourse with the brusque, unrefined neighbours had neither blinded 't' passon' to Yorkshire failings nor altogether opened Yorkshire eyes to Hampshire virtues. Hence a state of constant friction, as unsatisfactory as it was irritating.

'Found it, mother?' came at that moment in Ena's bright voice, as she stood in the doorway. 'No? Then let us call Jane. She may have moved it.'

But Jane, a respectable, middle-aged woman of scrupulous honesty, which had stood the test of ten years in her present situation, professed herself as ignorant as the rest of the world. And gradually perplexity merged into anxiety.

'I must be off; my chicks will be waiting,' cried Ena at last. During eighteen months she had held the post of governess to the two young daughters of the same Mr Wakelin whom the vicar had just characterised as 'particularly unpleasant.' But, whatever the father's faults, Ena loved the children, and anticipated with genuine pleasure the hours spent each day in their instruction.

It was a large and important as well as perfectly new house, that towards which, five minutes later, she was hastening.

'None o' your old, nasty, pokey cribs for me,' Joseph Wakelin had declared, immediately after the lucky *coup* in iron which had brought him

his fortune. Whereupon he had set to work to build this red brick, imposing, comfortable, vulgar edifice, which he had then stuffed full of furniture, upholstered in startling colours, but affording the maximum of physical ease. Nowhere could sofas and couches be found of less artistic form, of cruder hue, or with more irreproachable springs and cushions than at 'The Hall,' the designation displayed in scrolls of iron-work above every gate.

It so happened that, quite out of the usual order of things, Ena that morning encountered the master of all this splendour upon his own doorstep.

'Late, ain't I?' he exclaimed, recognising her presence by a simple nod. But Ena was not so thin-skinned as Mildred. Possibly residence amongst these folk from childhood had blunted her perception of their peculiarities. 'Wasn't particular bright this morning, so I slept in. The changes in the weather don't suit me. It's like a furnace to-day, and so it was yesterday. How your father manages to walk about in that Inverness of his beats me!'

Ena laughed. The vicar's hatred of the cold was a constant source of wonder to his hardier flock.

'He's got his thinner coat to-day,' she retorted. 'Even he thought the other too heavy. I hope you'll be all right soon.'

'Thanks. By the way, if I go to the schools, shall I be likely to find his reverence? I rather fancy the walk there instead of going to the office,' with a guffaw at his own confession of idleness.

'I trust so, I'm sure. But when I started, all the house was upset searching for the pupil-teachers' salary money. You know the vicar's way of mislaying things; and money's no exception.' With which she passed on, never guessing at the suspicions already at work within her employer's brain.

'And that chap Clarke is bothering for his bill. What made Russell so bloomin' pressing to have cash instead of a cheque, as he always has had afore? I've fancied at whiles as pride would have a fall. Maybe it's tumbling now.' And though he did not add 'Hope as much!' it is quite probable that his sentiments ran in that direction. His resentment that the vicar would never admit him to the confidence and intimacy of an equal—for class-pride was certainly as great a failing upon the part of Charles Russell as was purse-pride upon that of Joseph Wakelin—had long ago influenced his mind against the man whose whole annual wealth would not have afforded him a week's income. To be able to despise the clergyman as he believed that he was despised—such was his pet though unacknowledged ambition. Almost he fancied that he saw his way to its fulfilment when, twenty-four hours later, he sat and talked over the strange occurrence of the vanished money with the vicar in his study.

'I can find the coin nowhere. Mrs Russell and I have searched the house from cellar to garret. If it had flown to the clouds it could not have disappeared more unaccountably,' exclaimed the clergyman, whose pallid face and red-rimmed eyes told of a sleepless night. 'I can't imagine what to do next in the matter.'

'Then you don't deny you had it from me?'

'Deny? What do you mean, sir?' firing up instantly. 'Of course I had it. Your insinuation.'

'Oh, blow my insinuation,' coarsely. 'What about burglars?'

Charles Russell drew himself up; but, though his voice was cold and his face hard, he still replied to the question. In truth, he understood already the false position in which this loss had placed him, and realised that his reputation demanded an answer to all inquiries, howsoever unpleasant.

'Very unlikely, though still possible. The window is not on the ground-floor. And any one entering from the hall during the daytime could scarcely fail to be observed. Though, as I have said, it is just possible that might have been managed.'

'And servants?'

'There is only Jane. All the parish is acquainted with her, and would vouch for her integrity. No! Whoever was the thief, it was not Jane.'

'He's a fool,' the other decided, listening and watching. 'Has he used it? At least he'd better try and throw the blame somewhere. But no! He'll save his conscience that far.' Then aloud, with a look of the utmost insolence: 'So the scamp is as usual "Mr Nobody, or the cat"—with a scoffing laugh that positively chilled the blood in his companion's veins. This man, with all his presumption, would never venture to behave with such freedom had not his vicar fallen very low in his estimation. So the clergyman believed, at any rate. But even now he was not prepared for what was to follow.'

'Look here, Russell,' the other said, bending forward in his chair and speaking with a show of indulgent good-nature. 'I understand. I'm just as cocksure as you are that Clarke's bill was settled within an hour after I left this house! I'm out and out certain, too, that you haven't twenty pounds to repay—well, call it the loan! You make a friend of me, and I'll do my best for you. Come now. 'Tain't every man would, after as much.'

Nor, had the confidence been accorded, would he have betrayed the trust. Only to be recognised and acknowledged by the vicar as a benefactor was his sole desire. He had really no wish to lower the cleric in the eyes of the world, or to see pretty Ena's father—he was quite fond of Ena, he assured himself at this point—publicly dishonoured.

For a few seconds there was silence in the room, a silence which could be felt. Then, very slowly, and with a face of ashen whiteness, Charles Russell rose to his feet. 'Sir! Mr Wakelin!' he thundered. 'Do you dare to harbour such an opinion of me, and to tell me of it to my face? Go!' pointing to the door, 'go, and do your worst! But never cross my threshold again.—Go!' as the other, in pure astonishment at the outburst, remained motionless. 'Again I command you, go, lest I forget my office, and kick you out of the door!'

'Father, there's a gentleman named Daintry down-stairs in the drawing-room, who is very anxious— Oh, I beg your pardon! I thought you were alone,' were the words that interrupted this crisis, giving Mr Wakelin time to gather his

wits together, and falling like cooling drops upon the flame of the clergyman's ire. But it was the manufacturer who replied to Ena's announcement.

'He will be in a second! I'm off! And don't you suppose I'll ever bother you with another offer of help. Miss Russell, you needn't come to my house again. The missis can find some un better than a thief's daughter to teach my little gals. Good-morning to you.' With which parting shot he departed, stamping down the stairs in a fury, and slamming the hall door behind him; yet carrying away a conviction, which had been growing stronger during every moment of the interview, a conviction of Charles Russell's entire innocence. That it was a conviction which he intended neither to act upon nor admit, did not in the least prevent his recognition of its presence in his most unwilling mind.

'BARRA IN THE MINCH.'

'THE real Barra is in the Minch,' said the speaker sententiously; and then added, with emphasis, 'the real, rich, valuable Barra is under the sea; the rock they call Barra is only for the huts and the landing of the boats.'

While there is much truth in this, where a fleet of six or seven hundred splendid herring-boats fill Castle Bay with wealth and activity, yet there is another Barra above water of much interest. Although 'far amid the melancholy main,' with the solan geese from St Kilda flitting constantly about it, the island is by no means the miserable rock we are occasionally informed by those who have not made it a study, or who have only seen the herring-debris-covered rocks. The bay itself, formed by the island of Vatersay, lying opposite, is a splendid haven; and the old castle of the McNeills on the islet off the pier gives a look of picturesque antiquity to the general view. Vatersay sands whiten and brighten the opposite shore of this great herring centre. The North Harbour is scarcely inferior to Castle Bay itself, and enables every portion of the waters surrounding, whether towards the Atlantic or the Minch, to be fished with safety. Although little over a thousand feet in height, the position of the island makes the view extensive and commanding; and during the herring-fishing season it is also a wonderfully busy and interesting scene that presents itself to the eye from the summit. The Laurentian rocks have been triturated by the constant gales rubbing the loose stones and particles violently together, until considerable humus has been formed in places; while the western shore is a magnificent stretch of the finest sand, that is ever shifting and lifting under the restless winds and waves. These sands were a constant source of danger to the adjoining arable land, where the western valley slopes to the sea, until a former factor succeeded in fixing the higher stretches by planting bent thereon. This has continued to extend, with its long siliceous roots that bind the shifty particles together, until a great extension of grazing land has succeeded.

Over this ground the botanist may ramble with amazement and delight, wondering how, even in the early spring, when Skye is black and dreary, these inner sands are rich in verdure and gay with flowers. This is the more surprising as the sands are mostly silicious, with far less admixture of disintegrated shells than might have been anticipated. For the wild coast outside only permits the limpet to flourish, and even these are few in number, and must maintain a most precarious existence. But the mild air, moisture-laden from the south-west, however violent at times, is kindly in its result; and even amid the apparently barren rocks of Castle Bay, flowering plants are numerous throughout the year. One gentleman in July gathered somewhere about two hundred; whilst a party of students in a few hours' ramble round the island during August collected within twenty-five of the same number. Wherever any humus had gathered, these plants were numerous and varied. To this humus the sea has added to an important extent, more especially within the last generation. For the great herring and cod and ling fisheries mean a collection of debris sufficient to enrich a great extent of arable land if properly employed. But here we find a strange commingling of care and recklessness on the part of the inhabitants, who fight violently over every square yard of land, and yet throw into the sea the hundreds of tons of herring garbage that ought to be transferred from 'Barra in the Minch' to Barra that rears its head above it.

The people of Barra are a race of hardy seafarers, and are admirable boatmen, while they possess a very considerable stock of clever ponies among them. These ponies are considered the lineal descendants of the Spanish ponies of the Armada, and have always been famous trotters across the mile of sand of Cockle Bay which is their favourite raceground. The ponies, too, have done the work elsewhere allocated to the women in the Hebrides, and with their panniers have carried the peats from the higher moors to the clachans. The crupper spoils the look of the ponies for sale, unless caught at an early age; but the use of these animals has probably been beneficial to the women, saving them from exhausting hard work when very young. However this may be, the men of Barra do not compare in physique with those of Lewis, whose women undergo the burden and heat of the day to a greater extent.

In old days the food of the people is said to have largely consisted of cockles boiled in milk; but of late years a large business has been done in sending tons of cockles from the famous bay to the English markets. Great recklessness has as usual been shown in the depletion of these beds, whenever the prospect of gain stimulates the regardless use of what is common property. So long as they were only used for local consumption, they stood the strain for centuries; but when shipped without consideration in the wrong

season, and no care given to the beds, the result has been very injurious, and may remain so for a time.

In the old 'kitchen middens' of some extent in the west, shellfish are the prevalent remains, along with occasional fragments of the antlers of the deer. These could scarcely have belonged to this small island, and were probably the result of raids elsewhere by the turbulent M'Neills, whose stronghold on an islet in the sea rather points to a race of seafarers. Indeed, whoever seeks to enjoy Barra must be almost amphibious. Peat grows plentifully on the western slopes, and assumes strange appearances where the swift streamlets from the heights undermine it in long subterranean passages, with occasional larger cuttings, as if underground dwellings were about.

The pasturage, as we have seen, is rich and varied, and a fine stock of Highland cattle browse on the north end of the island, which herd at one time belonged to a brother of the famous Macgillivray, whose classic descriptions of the haunts of the sea-fowl may have been largely gathered from these wild Hebridean shores.

Barra out of the Minch is indeed well deserving of closer study, while 'Barra in the Minch' has not yet been developed to its fullest possibilities. This quaint corner is an epitome of the old times and the new. The fish-pond alongside the old castle, with the garden near the shore opposite in a little dell, are indications of the mode of existence of the chief; while the huts of loose stones and turf, the thatch green with verdure, the oats and potatoes scrambling amongst the rocks, tell of the desperate struggle for existence of the old-time vassal. Then the old broch nodding at the Atlantic tells of a still prior ownership; while the M'Neills' judgment-seat, with the place of execution just behind, recalls the rude prompt autocracy of the feudal times.

A short stroll leads to the less picturesque but more important modern conditions, where rival curers have erected wooden shanties, and piers, and curing-houses; and the air, and rocks, and water force on nose, and feet, and eyes the presence of King Herring. It brings into the island much money; it eliminates the old-world simplicity and purity of life. Although Roman Catholicism still controls the multitude, and the bottle of holy-water is hung on the bow of the boat, contact with the outer world has emancipated the minds of the people to a large extent. They still potter away over a few yards of oats or a patch of potato-land. They still spend too much time with their hands in their pockets. They still remain too often ashore when they might do well digging deep from 'Barra in the Minch.' But this time of transition will pass. They have become dissatisfied with their condition; this will lead to dissatisfaction with themselves, the first stimulus to future advance. The steamer of The Island Route has been gradually creating a new Barra, and a small town has already replaced the clachan of a dozen years ago. The failing fisheries will return, and 'Barra in the Minch' be gradually transferred to Barra that so boldly and gracefully dominates the western seas.

There is an admirable and well-managed modern hotel, built by Lady Gordon Cathcart, to develop the island; so that no inconvenience need be experienced by the ordinary visitor. A run

from Oban, therefore, can be readily made, and a dip taken, with little hardship on a summer day, into quaint old-world conditions far removed from the experience of the ordinary citizen.

MORE HOSPITAL STORIES.

POLICEMEN IN HOSPITAL.

By G. B. BURGIN.

POLICEMAN X 274 was inclined to be pessimistic, although convalescent. Whenever I could spare time from my other duties in the hospital, I would run into his ward and remind him that although he had been hard hit by a brick on the back of the head in a street row, life still had its compensations. There yet remained a little formality to be gone through on his complete recovery, when he was to be presented with a small cheque by the presiding magistrate of his district for having tackled Redheaded Mike single-handed, and utterly unmindful of the affectionate tokens of regard showered down on him in the shape of anything which came handy by the enthusiastic friends of that Ilibernian swash-buckler. One of these tokens—namely, the brick—had smashed in his head; but the head of Policeman X 274 was very thick; so was his helmet; hence the brick had only incapacitated the worthy policeman from duty for some two months, and not 'kilt him entirely.' Still, Policeman X 274 remained pessimistic. He said that the brick had not only upset him, but his theories as well, and that he now felt it his duty to become an ardent Conservative. This was after I had enlarged on the practical part of Socialism to be met with in London slums. Policeman X 274 raised himself up in bed, and waving an imaginary truncheon, delivered himself thus:

'You'll excuse me, ma'am, for contradicting my betters; but Socialism's mostly talk. So is all other "isms," if you looks into 'em on your beat of rainy nights, when you've got time to think things out. Folks preaches Socialism and travels first-class. When a man here and there acts up to it, he's mostly queer in his head, and we generally runs him in. They all talks of going shares, these Socialists; but it's mostly other men's property they wants to divide. In the "force," we most of us sticks to our own shirts and handkerchiefs—when we've got any. There was a young Doctor I knew, ma'am—used to see him on my beat frequent—who'd talk to anybody, and give away his clothes ever so free. This young Doctor used to attend Socialist meetings when he was on duty, and the other Sawbones would chaff him because he hadn't time for nothing else. The hall where these meetings was held was on my beat, and sometimes people would be a bit thirsty.

'Socialists in the back streets, having nothing to lose, is apt to pick up odds and ends permissive-like sometimes, and somebody's got to be run in. This young Doctor kept on spouting at the meetings till the other doctors got sick of equality and the rights of man. Everything down was to go up, and everything up was to go down.

'Well, one night, there was a man knocked

down, and me and a mate took him to the hospital. Just as we was standing in the entrance, the young Doctor came running up very excited like. "Officer," he says, "come in here and arrest 'em all. They've stolen everything they could lay their hands on." So I goes up to his room, and there was nothing in it but a carpet. Curtains, pictures, furniture, were all gone. Then he takes me to one room with a gray-haired surgeon sitting in an armchair and wearing a smoking-cap. "Officer, do your dooty," he says. "That's my chair and cap, and he's got my best trousers on." Then he takes me to another. "Officer, this fellow's stolen my table, and bed, and washstand."—"Don't be an idiot," says this man, quietly smoking. "In the first place, you've got to prove it's your bed; in the second place, you've no more right to this bed than I have: each man is as good as any other man; and when a man hasn't got a bed, the best thing he can do is to take some one else's and stick to it—if he can." And so they all went on, till he began to see I couldn't take up the whole hospital staff, and promised to give up Socialism if they'd return his things, which they did, and stood him such a supper afterwards, he couldn't tell who'd got his trousers and who wore his cap.'

After Policeman X 274 got well, his chief idea was to testify his gratitude to me by bringing 'cases' whenever there was a chance. One evening he came to the hospital with a small but mischievous-looking boy. 'Do you know this youngster, nurse?' he asked.

'No.'

Policeman X 274 was disappointed. 'I thought you knew everything, ma'am. This youngster can't tell his name, but said something about a hospital. Just come from the seaside. Put in charge of an old lady at Brighton. Old lady very deaf. Told us to take him to the hospital: she didn't want him. He'd pulled all the feathers out of her parrot. If you could have seen that parrot, you'd have believed it. He was as naked as original sin, ma'am, and twice as ugly.'

Policeman X 274 departed; but the doctor in charge objected to giving the child a bed for the night. The child, however, was evidently used to hospitals, and proceeded to make himself comfortable. The next morning, his anxious parents appeared on the scene, as well as the old lady, the latter explaining that it was the parrot she had wanted taken to a hospital, but that the stupid policeman had gone off with the child, and left her precious bird in a state of nudity. Fortunately, it was warm weather, and she hoped her dear parrot would get over his scandalous treatment. I rubbed a little vaseline on the bird's ungainly person, and she went away contented.

Policeman X 274 wiped his perspiring brow when the old lady had departed, parrot and all, and accepted a douceur from the boy's grateful parents with an ease evidently the result of long practice.

'That's what comes of trying to do your dooty, ma'am,' he said. 'It's usually the tother way round, though. All the women are very kind, and it's the men don't like us. The old ladies from the country always calls us "officer"'

or "sergeant," and though you know they're "kidding" you, it's pleasant, all the same. But men are always pleased when a bobby comes to grief. I was trying to get into a 'bus once, and slipped. I daren't let go of the handrail, and was dragged along on my stummick half-way down Cheapside. The conductor was up on top and didn't see me, and no one inside tried to stop the 'bus 'cept a sweet old lady who asked her husband to interfere. He looked out. "Oh, it's only a bobby," he says, without lifting his hand; "and there's plenty more of 'em where he comes from. They're always dragging other people through the dirt. Now, it's his turn." Americans are very different. One old lady tried to get me to go to New York to take care of her, and said she wished the police would emigrate there, 'stead of the Irish.

But the duties of the London police are not confined to looking after the welfare of old ladies. When an unfortunate man has attempted to commit suicide, he is generally taken into a hospital by policemen, one of whom accompanies him to the ward and remains there until he is relieved by another member of the force in plain clothes. From that moment up to the day of the patient's departure, a policeman is in constant charge. If a man has tried to kill himself by jumping through a window, he is often picked up with a broken leg, sometimes two. When he is settled in bed, he is comparatively safe; at any rate, there is no fear of his getting up; but he has to be watched always. Patients who have attempted to commit suicide are kept under observation, even if they may appear to be thoroughly sorry for what they have done. A man who has cut his throat might do himself harm by meddling with the bandages, although in cases of this kind they are specially planned to reduce the risk of interference. X 274 once brought in a pretty young girl who had jumped out of a window and broken one thigh. She puzzled me at first, with her low sweet voice and beautiful Irish eyes. All who saw her felt that the tragic side of life was before them, and that this poor girl had been cruelly treated by

Fate, Fortune, Chance, whose kindness,
Hostility, or blindness,
Plays such strange freaks with human destinies.

It transpired, however, her temper was very bad, and that after a few words with her husband about 'another lady,' she had thrown herself out of the window 'to spite him.' He came to the hospital and assured her that she had no reason to be jealous at all, and evidently thought there was nothing unusual in the step, or jump, rather, which she had taken to prove her superiority to other wives.

Sometimes X 274 would bring to the hospital elderly people who had made very feeble attempts to do themselves bodily harm. They settled down so comfortably in the ward, and were so glad to get there, that the presence of a policeman seemed a farce. They had no intention whatever of making any further attempts on their lives, because the first one had given them all they wanted: they were in the required haven, with every intention of making a very gradual recovery. There the policeman on duty would—especially if it were X 274—prove an

acquisition to the whole ward, and lend a hand at any job which did not take him too far from his charge's bed. Generally, he and his charge would play draughts or dominoes, and discuss Home Rule in the intervals between games. As a rule, a member of the force is a more desirable caretaker than an ordinary male attendant who thinks—as one of them told me—that 'minding deleterious patients [I think he meant 'delirious'] is an easy way of earning a living.'

Policeman X 274 when on duty in the ward suffered much mental anguish from the different views taken of his interesting charges by casual visitors. 'Dear me,' said one elderly spinster, 'do you mean to say that man actually tried to cut his throat?—How very interesting!' Then she turned to her companion: 'Tried to cut his throat, my dear!—Would you mind asking him, officer, if he did it with a razor or a kitchen knife?' In this instance the 'patient' had some sense of humour. Raising himself on one elbow, he beckoned the visitor to approach. 'I allers does it with a chopper,' he said with a ghastly chuckle. 'You wait till I git out, and if you likes to come down our Court, I'll show yer.'

Very poor people, as a rule, who had 'a friend or brother there,' as the poet puts it, were not much shocked by the awful nature of such a deed as attempted self-murder. They would often discuss the pros and cons with X 274 quite dispassionately, and seldom asked when his 'patient' would be discharged. In the first place, they usually did not want him back; and in the second, they knew that there was a little indispensable formality before a magistrate which might necessitate a certain period of imprisonment ere the 'patient' was allowed to return home again.

I soon got on very friendly terms indeed with X 274. He brought in accidents, called for reports, carried wounded children to me, or discovered their friends in a manner which was simply marvellous. I had only to tell X 274 I wanted the relations of a wounded child; and he would shortly return with a whole crowd of people, who invariably told me that 'the gentleman said you wanted us, ma'am, and that if we didn't come at once, begorra, he'd make us.'

'Yes, ma'am; I finds "workus ladies" very trying, poor old bodies,' X 274 one day admitted in response to a question of mine. 'There was one old lady who got to know me so well, I hadn't the heart to spoil her enjoyment. "Now, you dear good man," she used to say to me, "I've had sixpence subscribed by a few kind friends for a little liquid refreshment. Here is twopence (she never said "tuppence," like most people. She'd been a real lady, she had—kept a school once) for you in case the—the sun gets to my head, when I shall expect you to have the goodness to escort me to Lockhart's Cocoa Rooms, and to call for me after I have had a slight nap."—The "sun" got to her head reg'lar, ma'am, and I'd take her to the cocoa place, and make her comfortable in a corner, and fetch her some tea when it got out again. They knew her ways at "The House," and never got uneasy about her. When I was off duty, I'd slip into plain clothes, offer her my arm, and take the old lady back again in style. "Policeman, I thank you for your

courtesy," she'd say to me, with a little old-fashioned bow. "You have a feeling heart, and I hope you will one day become an Inspector." Then the poor old body would toddle in and go to bed quite happy. One day, "the Duchess" (that's what they called her) didn't come. She'd asked 'em to give her little old Bible to "that dear, good, patient policeman, with her love;" and then she died. I changed my beat after that. I couldn't stand it when her reg'lar day out came round and she didn't turff up.

'Now, factory girls is different,' continued X 274 meditatively. 'I was going over Waterloo Bridge one day, and my helmet come off in the rain and wind. I ran after it. "Don't kick it, sir; please, don't kick it," said a voice. I stopped to see what was the matter, and the helmet rolled under a wagon wheel and was squashed. "Got yer that time, sergeant," said the voice. It was one of them cheeky factory girls, ma'am, and she'd done it on purpose, to get my helmet squashed.'

'It's anxious work being on a City beat,' reminiscently continued X 274. 'You get to know a lot about other folks' business too. It's amazin' what old ladies will do. Why, I've had one stand in the middle of a crossing and explain she'd just been to the Bank. Then she'd put her hand up to her chest in an anxious sort of way, so as any thief within a mile could see where she'd shoved her money. I've actually seen old ladies from the country stand just inside a Bank and put their money into their under-pockets or the bosom of their gowns. They'll do the same thing coming out of stockbrokers' offices, and then be surprised they're robbed. I often wonder any of 'em gets home safe, though some country folks in 'town are mighty suspicious. The young men who come up on 'scursions hides their watches in their trousers pockets and forgets to tuck in the chain. It's wonderful work being on a beat nigh Exeter Hall, too, when the May Meetings is on. A rum lot of people comes to those meetings, and they're mostly main pleased with themselves. Noah's Ark isn't in it when it comes to some of the clothes the old uns wear. The young uns mostly gets new boots to come to town in, and tries to seem as if they didn't hurt; but you see 'em looking in all the windows, and standing on one leg to ease the other foot.'

'The old Quaker ladies as come to town for their meetings is very different, and mostly smells of lavender all over. There was one old lady I remember at Charing Cross once. She'd got into the wrong 'bus, and the conductor handed her over to me to look after. She was just like a bit of old china or a wax image, and had white ribbons to her bonnet, and a bit of white stuff round her throat to match her snow-white hair. She must have been about eighty. When I took her across the street and put her in the right 'bus, she stretched out her little bit of a hand and shook my big un quite heartily, and says: "Friend, I am much obliged to thee. When thou art eighty, I hope the dear Lord will raise up as good a friend for thee. Lord bless thee." But they ain't all like her.'

The next time I saw Policeman X 274 he was brought in on a stretcher, after having stopped a pair of runaway horses. I insisted that I should

nurse him. During his delirium, I found out that at one period of his career he must have been a coachman. He'd sit up in bed quietly enough and then begin to pull off his quilt and fold it up tidily, saying he shouldn't want a rug, and would have it on the driving-box. Then he'd talk to the horses, as if he could see them, or begin to fold up his blanket just like the counterpane. When he started on the sheet, I would go quietly up to him and say: 'I think it's going to rain to-day; I wouldn't fold up the rug if I were you. Just keep it across your knees. Then you'll be all right.' He would answer me quite sensibly: 'Very well; that's 'll right. A shower 'll lay the dust.' Now, he's pulling round a little, and will be taken off to the country as soon as he's able to move. There are rumours of promotion and another presentation when he comes back. He deserves both.

IS AN ICE AGE PERIODIC?

THERE was a period in the distant past, we are told, when the climate over the northern hemisphere, above the fortieth parallel of latitude, was far more genial and equable than it is at present. During many consecutive ages this vast region enjoyed an alternation of long mild summers and short mild winters. In the vicinity of the Pole the earth was free from the incubus of the desolating ice-sheet, for even the circumscribed area of glaciation coeval with the period of human history had no existence.

A climatic condition so beneficent is delightful to contemplate. The more inviting does it appear in recollection of recent wayward tendencies of the British weather, such as sharp and protracted winters, ungenial summers, and generally mixed and uncertain seasons. Then the pleasure of confident belief that Boreas, the blustering terror of the year, was deposed, and his throne dissolved for several thousand years; that no more could the tyrant vent his fitful moods in icy blasts that skirmish into the heart of spring, and even chill the breath of summer. No creeping glacier or crushing icefloe would paralyse the efforts of Arctic adventure. The Pole itself, and the North-west Passage, once the goals of heroic endeavour, would be accessible to the ubiquitous tourist, whose course would lie along pleasant waterways, and in sight of shores clothed in the luxuriant verdure of almost perennial summer.

But disastrously for such fanciful speculation there is the dual nature of the cosmos to be reckoned with. The universal law of compensation balances one extreme of vicissitude by imposing another of a precisely opposite character. The genial period would be merely an oscillation—a swing in one direction of the terrestrial pendulum. The long period of warmth and luxuriance must be preceded, or followed, by that calamitous agency an Ice Age of equal duration.

At such time the heat energy of the then short fierce summer is ineffectual to dissipate the cumulative effects of the long cold winters. Immense glaciers would be formed—glaciation would gradually spread southwards from the Pole until a considerable portion of the northern hemisphere,

including the greater part of Britain, was buried beneath an ice-sheet one thousand feet or more in thickness. The natural features of the land would be torn and scarred, the population driven out or destroyed, and the puny works of man ground and pulverised into effacement by the enormous abrading and crushing force of the moving masses of ice.

A vast interval of time has elapsed since the end of what is known as the Great Ice Age. The tracks of the glaciers are plainly visible. The glacial deposits, clay, moraines, and boulders, are abundant and distinct. But the testimony of the rocks is imperfect as regards a correct approximation of the period when that stupendous phenomenon prevailed; and absolutely void of evidence respecting its recurrence in the future. So vast and incomprehensible are the intervals of time involved in these cyclic changes, that such a tremendous agency might well be thought peculiar to a long past geological epoch. An ice age has therefore been regarded as an evolutionary phase of the distant past impossible to recur. So far from having only an archaeological interest, ice ages are not without significance for the future of the human race, however remote. The agencies that produce them are still operative. An ice age will assumably occur when the earth's orbital situation again favours glacial development.

It is probable that from time to time certain stages in the earth's perturbation may transiently influence climate in a minor degree. A series of cold winters and cheerless summers, for example, may find an explanation in planetary influence. Indeed, Sir Robert Ball refers to these cold winters as premonitory of the dread climatic vicissitude, an ice age, which he maintains is destined to recur within a measurable, though distant, period.

A distinction must be held between weather periodicity and the gigantic cycle of climatic change. Sun-spots, for instance, influence the weather from year to year. But their influence is fleeting, and well within the limit of normal climatic range. The great sun-spot of February 13, 1892, indicated a maximum of solar activity. Resultant maxima in certain terrestrial phenomena were evidenced by unusual magnetic perturbations, remarkable auroral displays, terrible inundations and tornadoes in America, and a disastrous hurricane in Mauritius. It was suggested that a sun-spot of such unusual magnitude and grandeur, by affecting solar radiation, might have caused the sudden fall in temperature which followed its passage across the solar disc. Sun-spots, however, do not so affect solar radiation. Probably the true cause of thermal fluctuation at such times is atmospheric disturbance by the magnetic property of the solar heat-rays.

From century to century the relative position of the earth in the plane of its orbit is, within certain limits, never precisely the same. The form of the earth's orbit and the direction of the earth's axis are constantly changing. These two perturbations constitute two distinct cycles of change, differing vastly in the time of their completion. Their progressive motion is exceedingly slow. The utmost limit of orbital eccentricity is only attained in a gigantic period of time. But during the waxing and waning of the orbit there are many revolutions of the line

of equinoxes, caused by the polar rotation of the earth, each rotation occupying a net period of twenty-one thousand years. There are also slight and temporary aberrations of the earth from its true orbital path. These may exercise some passing meteorological effect; but they have no bearing whatever upon climatic change.

The planets of our system are tugging at each other with prodigious might; so great is the energy of planetary attraction, that when expressed in tons it surpasses comprehension. One result of these disturbing forces is to alter the earth's nearly circular orbit into an elliptical course, which as gradually changes back again into the circular. The utmost attainable eccentricity of the orbit would by itself appear to be too unimportant to cause extensive glaciation. The orbital form must therefore be associated with the polar rotation. This is a kind of swaying motion of the Pole about the axis, something similar to that of a spinning-top when about to fall. The Pole describes a circle in the heavens, causing an apparent revolution in a contrary direction of the twelve constellations in the ecliptic known as the signs of the zodiac. As the earth sweeps along in its majestic course, a consequent small annual change in the direction of its axis brings the point where the equator intersects the ecliptic a trifle farther to the eastward of the position of the preceding year. An apparent retrograde motion of the ecliptic results, which is known as the precession of the equinoxes. A complete revolution of the line of equinoxes occupies a net period of twenty-one thousand years.

It is therefore not the eccentricity of the orbit alone, nor the polar rotation alone, that can produce an ice age or a genial age, but a certain obliquity of the orbit, which is the combined and net result of both the perturbations. The effect of the earth's position at the period of greatest orbital eccentricity is to disportion the length of the seasons, and the mean daily sun-heat, in either hemisphere, and thereby to induce two opposite climatic extremes, glaciation in one hemisphere co-existent with interglaciation in the other hemisphere. An ice age, say, in the northern hemisphere, and a genial age in the southern hemisphere for a period of ten thousand five hundred years. Then, as the Pole swings round half a circle, and inclines the earth's axis in an opposite direction, the southern hemisphere becomes glaciated, and the northern hemisphere genial, for a like period. So slow are the terrestrial motions which contribute to these phenomena, and so vast a period must consequently elapse before the earth can extricate itself from its extreme position, that two or more ice ages may alternately occur in either hemisphere.

The astronomical theory of climatic change is attractively set forth in Sir Robert Ball's admirable little treatise on the subject. While properly disclaiming any particular novelty for the facts and inferences, the theory is therein discussed in the modest and unpretentious spirit of true scientific research; and the argument is conveyed in such familiar terms, that any lay reader possessing a rudimentary knowledge of planetary motion can readily grasp and assimilate the conclusions.

At first sight it is difficult to realise the ade-

quacy of the greatest attainable obliquity of the earth's orbit combined with the polar rotation to produce the extraordinary thermal changes claimed as a consequence. With reference to this difficulty, Sir Robert Ball emphasises two essential elements in the astronomical theory. Misconception of them has hitherto vitiated deduction from planetary perturbation: one of those elements is the comparatively small diminution of solar heat necessary to set up glaciation; the other is the true 'proportion of summer and winter sun-heat received by either hemisphere.

In estimating the thermal changes requisite to induce extensive glaciation, it would be entirely wrong to reckon the heat given out by the sun according to the average measure of summer and winter heat upon the earth. Suppose these to be respectively sixty degrees and thirty degrees; the proper zero to reckon from will be the temperature of space, which, at a very moderate estimate, will be three hundred degrees below the zero of Fahrenheit. Therefore, the entire heat given out by the sun, reckoned from the temperature of space, will be respectively three hundred and sixty degrees and three hundred and thirty degrees. Consequently, a reduction of the earth's summer or winter heat to the zero of Fahrenheit would constitute a loss of only one-twelfth or one-eleventh of the entire heat given out by the sun.

Then as regards the due proportion of sun-heat. The heat-measure received by the whole earth must be considered as a constant quantity, every year alike. But the vital point in this connection is that the yearly heat-measure received in either hemisphere is unequally distributed over the year, in a fixed and unchangeable proportion. Suppose the yearly heat-measure in either hemisphere be denoted by the number 100; then the proportion of summer heat will be 63, and of winter heat 37—no matter what may be the value of the yearly heat-measure received by the whole earth, no matter what degree of eccentricity the earth's orbit may have attained. At all times, and in every aspect of perturbation, the proportions in either hemisphere will be 63 and 37.

At the present time, in the northern hemisphere the sun is above the equator one hundred and eighty-six days of the year—that is to say, the summer in the northern hemisphere is now seven days longer than the summer in the southern hemisphere. Were the earth's orbit to permanently retain its present form, this difference of seven days in the seasons of the two hemispheres, being about the relative maximum, would continue to alternate between the two hemispheres in accordance with the direction of the earth's axis.

But when, in the lapse of ages, the earth's orbit reaches its greatest eccentricity, the difference in the length of the seasons in the two hemispheres will amount to thirty-three days. One hemisphere will then enjoy a long spring-like summer of 199 days with 229 heat-measures, and a short mild winter of 166 days with 136 heat-measures. The climatic conditions of the other hemisphere will be exactly the reverse of these. During the same period it will experience a short, fierce summer of 166 days with 229 heat-

measures, and a long rigorous winter over which will be spread only 136 mean daily heat-measures. The climate in the one hemisphere will be genial; that in the other hemisphere will be glacial. Notwithstanding the greater heat of the glacial summer, the earth passing much more rapidly through its perihelion, and the season being so much shorter, the fervid sun-heat will be inadequate to dissipate the accumulating deposits of the long cold winter. Great glaciers will form, and the desolating ice-sheet will spread itself over a vast area—a stupendous agency of destruction and calamity.

The astronomical theory of an ice age advances not one step beyond a simple thesis based upon demonstrable results of scientific research. The precise extent of planetary attraction, and its effect in periodically dragging the earth into an elliptical path, are familiar enough to the astronomer; and the resultant thermal changes are assumably calculable. The main purpose of the theory is to approximate the periods of these great climatic vicissitudes which the testimony of the rocks, however full and conclusive in other respects, is too imperfect to reveal. Thus the astronomer, with his unassailable evidence, comes to the aid of the geologist. In the astronomical theory he exhibits a potent agency in the cosmical evolution, and supplies a unit and a measure to hitherto indeterminate periods of geological time.

An ice age, as Sir Robert Ball reminds us, is not catastrophic. There is no sudden transition from smiling luxuriance to bitter desolation. The development of this stupendous phenomenon is as gradual as the planetary configuration that brings it forth. Very many generations of men will flourish and pass away before even the initial stage of another ice age is reached. Whether the next ice age will be as severe and overwhelming as that which has left its indelible traces upon the face of nature, or whether its intensity will be modified by the altered condition of the earth, is a question more properly in the domain of the physiographer.

MEMORIES.

A SONG.

O LOVE, since we two bade good-bye,
The regal roses' rich perfume
But calls the wild tears to my eyes,
And brings me dreams of pain and gloom.
'Twas 'mong the roses, O Sweetheart,
That all our farewell words were said;
Each summer from their graves they rise;
But you to me are dead, are dead.

The dearest treasure that I hold
Is just one rose your lips did kiss;
His golden store no miser hoards
Nor prizes more than I do this;
Yet bitter are the tears mine eyes
Upon its withered petals shed;
Poor ghost of glory once mine own,
Like it, your love is dead, is dead.

EGYPT FIVE THOUSAND YEARS AGO.

THE Archæological Survey of Egypt undertaken by the Egyptian Exploration Fund is proceeding under favourable auspices, and the results of each year's discoveries seem of increasing interest. Last year, several artists were sent out to make fac-simile drawings of the wall-paintings in tombs belonging to the eleventh and twelfth dynasties—that is, of a period about two to three thousand years B.C., or approximately five thousand years ago. These drawings, supplemented by portions of the original wall of a tomb which had been shattered by an earthquake, rendering the removal possible without any destruction on the part of the explorers, have recently been exhibited at the residence of the Marquis of Bute, and present many special points of interest. The freshness and beauty of the pigments employed in these very ancient frescoes are most remarkable. We are accustomed to look with wonder at the works of what we call the 'old masters,' and to think the colouring of Orcagna, Cimabue, and Giotto marvellous after the lapse of five or six centuries; but here we get colours which have stood the test of ten times that period, and yet retain their freshness and beauty almost unimpaired, so that you may trace the delicate gradations in the plumage of a bird, and thus classify numerous varieties of ducks, evidently domesticated and carefully bred; and even in the hieroglyphics the birds are so carefully portrayed that the species designed is easily recognisable. Three species of domesticated dogs appear with characteristics resembling those of to-day. There is a great lean-bodied, long-legged creature which might be the ancestor of our greyhound; but the legs are much thicker, and it is altogether more clumsy and less graceful. Then there is a dog possessing the characteristics of the boarhound, but with a mottled coat somewhat resembling that of a tortoiseshell cat. This colouring is also observable in the third species of dog, which has a strong affinity with the modern spitz or 'dachshund,' having a long body

and short bandy legs; but the latter characteristic is not so decidedly marked as at the present day. This little dog would seem to have been a favourite with the Egyptians at that remote period, for two of the kind are depicted, a male and female, one accompanying a lady in a close palanquin. It may here be remarked that a dog very closely resembling the one here portrayed is still found in South Africa, where it is bred and highly esteemed by the Hottentots, who even make the women nurse the puppies with their own children. This dog, known as a 'brach-hond,' is long-bodied and short-legged, but not so bandy-legged as the dachshund; the colouring also is more like that of the ancient Egyptian dog, being mottled, and often spotted with red like a cow.

There is also a cat, large and gaunt and fierce, certainly not our domestic tabby, but something approaching to the wild-cat. Whether this was the variety dedicated to Pasht, and of which so many mummies are found, can hardly be determined by the painting; but probably it was intended to represent that sacred animal.

The types of mankind shown on these very early paintings are of peculiar interest. There is the swarthy Egyptian ploughman, holding the primitive wooden plough, not, however, of the earliest type, which was only a crooked pointed stick driven by hand, whereas this is drawn by an ox, and has a cross-handle, painted red. Then there are the bearers of the palanquin, two of whom appear to be shaven, as was the manner of the Egyptians; whilst a third wears a full crop of hair or a wig, probably to denote superior rank. In another painting, rank is shown by the leopard-skin robe, worn apparently by an overseer, who is directing two workmen; and it may be remarked that even to the present day the leopard skin denotes the priestly caste, medicine-man, or chieftainship, in all parts of Africa.

Perhaps the most interesting of the human figures depicted is a group, or rather procession, of red-haired, light-skinned, blue-eyed people, supposed to be Lybians, the men bearing in their

hands crooked clubs resembling boomerangs, and having other weapons, notably a huge knife, thrust through their shaggy red hair; whilst the women carry their children in baskets on their backs; and two are depicted bearing monkeys instead of children. Conventionally, the Egyptian women are always represented as much lighter in colour than the men, and two groups in these paintings are especially remarkable. In one, two women are represented standing facing each other, one foot raised, touching that of the adversary, one hand being also placed on that of the other, whilst a round object, supposed to be a bladder, is attached by a long string to the hair of each at the back, hanging down to the shoulders. This is evidently a game, in which the performers whirl round and strike each other with the ball or bladder attached to the hair; and it is easy to see that, if the ball were not very light, the game might be an exceedingly rough one. In the other group, two women tossing balls are seated on the backs of two other women, the supposition being that when they fail to catch, they in turn become horses for the others. These two games of ball strike one as new, and especially noteworthy from the performers being women. The great peculiarity in all these human figures is the extraordinary length of the fingers and toes. In those days, it was evidently a mark of beauty to have a long foot and hand, and the artists must have complimented their subjects by exaggeration in these points.

Here, too, we may see the mode of making fire in the twenty-fifth century B.C., for we see a man represented using a fire-drill such as is still in use among some uncivilised races, which consists of a thong or bowstring twisted round a pointed stick, inserted in a very dry board, the thong being pulled rapidly backwards and forwards until fire is produced by friction. This is of course an advance upon the earlier practice of rubbing two sticks together, which is the custom among very primitive savages, and upon the drill twirled in the hand, which is also still in use.

The figures and hieroglyphs of these tombs, which are situated in the rocky ground on the east bank of the Nile, in the provinces of Minieh and Assiut, in Upper Egypt, differ from the generality of Egyptian hieroglyphs, which are usually incised in the granite, whereas, in these the figures having been first traced on the stone, the interspaces were then chipped away, leaving the design in relief, these raised figures being afterwards very carefully and beautifully painted. The Arabs have taken advantage of this raised-work, and have diligently chipped away the figures from all the fragments which have fallen into their hands, either out of pure love of destruction, or more probably in order to sell the painted hieroglyphs thus detached as amulets. This shows the necessity for completing the Survey as soon as possible, in order to preserve these precious relics of hoar antiquity from the hands of the modern spoiler, for the value of these paintings and hieroglyphs in illustrating the history of the world cannot be over-estimated. In them we see life as it existed in the most civilised country of the world three thousand years and more before the birth of Christ; the manners and customs, dress, and even the amuse-

ments of this remote time are here revealed to us. We can trace their commerce with distant lands, their modes of navigation and agriculture, their method of trapping birds, as well as the game they hunted and the water-fowl they domesticated, all so faithfully delineated as to be unimpeachable witnesses of the truth of ancient historical records; whilst the inscriptions enlighten us as to the names and exploits of their rulers, probably with some exaggerations and embellishments, yet on the whole trustworthy as to matters of fact, and incidentally throwing light upon much that is obscure in the writings of ancient historians, both biblical and secular.

POMONA.*

CHAPTER XXII.

Night brings us stars, as sorrow shows us truths :
Though many, yet they help not ; bright, they light not ;
They are too late to serve us ; and sad things
Are aye too true. We never see the stars
Till we can see nought but them. So with truth.

BAILEY.

'SAGE.'

No answer.

'Sage !' again, louder.

Still no answer.

'Sage, are you asleep?' with some irritation, for though that week at Scar had done wonders for Kitty, and she was beginning in many respects to shake off invalid ways, she had been so used for the last three months to have immediate attention paid to her slightest word, that this extraordinary silence on Sage's part was not to be endured patiently.

Owen Ludlow was occupied that August with a larger and more careful study of Scar Head than he had ever attempted before, from his favourite point of view for observing the sunset effects, from the rocks a little way along the shore beyond Scar. And here, day after day, his easel was set; and hard by, in a nook among the rocks, a comfortable resting-place for Kitty was contrived where a high rock cast a shade even at mid-day; and cushions and rugs accommodated themselves to an easily tired back; while, if she stretched out a hand, already a little bit less white and limp than when she came, she could lay it on cool brown seaweed, over which the sea washed at high-tide, and could pop the little knobs when she had sufficient energy.

Owen Ludlow was not at hand when Kitty spoke, though his easel and canvas still stood there. He had gone back to see if there were any letters by the second post, and had found a perplexing one for himself, which, however, had not prevented him from bringing down one for Sage directed in Maurice's hand, a letter which he knew had been anxiously expected all the week. He came and dropped it over her shoulder into her lap as she sat on the rocks, and then he walked on along the shore towards the point, pondering his own letter, with only one glance round at her radiant face as she held her lover's letter, examining the direction and postmark with a sort of childish pleasure in prolonging the infinite delight of opening it.

Kitty's voice sounded to Sage as if it were a long way off; but the last words seemed to take

hold of her senses, which were a little numbed and confused, with a sudden shock. Both be drowned? Well, that would be an end of a lot of trouble. It really would be difficult to get Kitty up that steep bit of beach all by herself; and the tide had a way of creeping in and turning those large stones into islands, and deepening and spreading, and then rising and covering one point after another, till there was nothing but smooth water, with the quiet moonlight over it. It would be a very easy way out of life's perplexities, and she would not be leaving Kitty. She had promised mother to care for little Kit, and she would not like to leave her so weak and ill. But if they were both drowned, they would be together, and mother would not need to say, 'Where's Kitty?' when they met.

She did not really mean it, of course. If such an impossible thing had happened as that they should have been surrounded by the sea, and Owen Ludlow should have forgotten them, and the dozens of kind hearts almost within hail in the village above been unconscious of their peril, depend upon it Sage would have fought desperately for her own life and for Kitty's. You know when people have had a sharp blow on the head, they are a little bit stupefied just at first; and it is the same when the heart is struck—the senses are dulled and blunted.

'Look ye here, Missy; shall I carry the little maid up the hill? She don't look fit-like to carry herself, and the clouds be coming up thick over you, and maybe we'll get some rain.'

It was Ben Caster who spoke, and he must have been close by while Sage was resigning herself and Kitty to a watery grave. And before they were half-way up the beach, Mr Ludlow overtook them, and relieved Sage of the burden of shawls and cushions with which she was laden, declaring that he would go back and fetch the rest after tea, as the tide would not be up there for a couple of hours.

On that former occasion, not yet a year ago, when trouble had befallen Sage at Scar, she was allowed the luxury of solitude and quiet in which to recover her bearings and face the future. She had no need then to speak of what she felt, still less to pretend to feel other than she did, and to swear that black was white, and cruel wrong right, and that she entirely agreed and was content with the new turn events had taken. Now she must collect her forces and arrange her line of defence with the smallest delay possible, for at any moment Ludlow, knowing whose letter he had dropped into her lap, might ask the natural question, 'Well, when is he coming?'

And then she would have to say that Maurice was not coming; that he would never come again; and, moreover, that it was quite right he should not come; and that she entirely agreed with all he said, and with the wisdom of ending the engagement between them. And then she would have to take up the cudgels for Maurice, even against herself, for she knew that Ludlow would be very angry, and would not pick his words in speaking of Maurice's behaviour; and she would not listen to that; and so, perhaps, she would lose her friend as well as her lover.

She might really have put off the dreaded explanation till the next day, for Kitty was tired

and exacting, and Ludlow went off after tea, and did not return till after Kitty was in bed, and when Sage might quite reasonably have gone to bed too, as Mrs Stock pressed her to do, being also struck by the girl's sad look.

'Twere just how my poor, dear husband looked before he had his first fit; and I says to him, "Job," says I, "whatever is the matter with you?" And he looked kinder skeered like, and asked for a drink of water—being a teetotaler, and that strick as he wouldn't touch a drop of brandy, not if it were ever so; but seeing as you ain't that way, leastways, not pledged to it, I'd recommend just a leetle drop, as I takes it myself nows and thens when I gets the spasms, though not one as approves of leetle drops took promiscuous.'

But Sage declined Mrs Stock's offer, and begged her not to sit up any longer. So Mrs Stock went creaking up to bed; and Sage was left just for a few minutes quite alone in the quiet studio, with the great white moon looking in at her, cruelly recalling that moonlight night when her poor, little love-story had begun.

She went out into the great moonlit stillness, on which the soft murmur of the sea below gently fell; and just for a moment she let her poor, little, forlorn self go, and cast herself down in the dewy grass under the old apple-tree, with her arms round the mossy trunk, and let the sobs that were stifling her have their way, and shake the small, prostrate figure in its passion of grief.

'Sage! Sage!' Ludlow's voice called to her from within. 'Why, I thought you would have gone to bed, child. I had to walk into Shingle to send a telegram.—Why, what have you been about? Your dress is quite wet. Have you been sitting on the damp grass? What an incorrigible little Cockney it is! never thinking of the dew.'

CHAPTER XXIII.

Yes, and he too! let him stand
In thy thoughts, untouched by blame.
Could he help it? if my hand
He had claimed with a hasty claim?
That was wrong perhaps—but then
Such things be—and will again.
Women cannot judge of men.

MRS BROWNING.

Before telling of the conversation between Sage and Owen Ludlow that night, and of poor, little Sage's gallant efforts to shield her lover from the just reprobation of his friend, I must tell of Ludlow's letter which had occasioned him the walk into Shingle that night. It was one that most artists would have hailed with delight, and with almost incredulous delight moreover, seeing that it was a fancy price that had been put on Mr Ludlow's picture, for it was a letter from his agent in London to say that the picture was sold at the price put upon it, and a cheque for the amount paid in to his banker's. 'I did not think it necessary to telegraph to you before accepting the offer, as, with all respect to your picture, the price put on it seemed such as to preclude any chance of a purchaser; and I believe it is only because the lady has some special fancy for it, some likeness in one of the figures I think it is, that she offered what some might consider an out-of-the-way price for it; and as these fine

ladies' caprices are not to be reckoned on to last long, I thought it better to close the bargain before she changed her mind about it. The purchaser is Lady Lester, of Beechfield and Park Lane. Her solicitor, Mr Freestone, came about it with the cheque ready drawn; and as the picture has been at our place since the Academy closed, and was still in its packing-case, I told him it should be forwarded to her ladyship immediately. —Hoping that you will approve my prompt action, believe me, &c.'

Now, as Owen Ludlow had lost all pleasure or interest in the picture since that interview with Pomona, he had not the same feeling about selling it which had impelled him to put a fancy price on it; and if it had been any one else in the world but Lady Lester, he would have been quite contented to let it go and hear no more of it; but somehow, as coming from her, it seemed the price of the actual Pomona in flesh and blood, not the Pomona in paint on canvas. There had been no sense of barter or exchange twenty years ago, when he gave his little girl to Lady Lester, though, indeed, the price he gained then was comfort and freedom from galling responsibility; but now, the cheque seemed like the completion of the bargain, and the idea of a man bartering his own flesh and blood for coin of the realm revolted him. And then, too, he guessed wonderfully near the mark at what Lady Lester meant, and how she had interpreted his meaning in that miserable picture. She had taken it as a threat that he might lay claim to this beautiful, proud, young beauty, and drag her away from her brilliant position; and the price he casually put on the picture, just because he thought it was beyond the outside limit of possibility for any one to give, had been interpreted as the price of his silence.

Such, indeed, roughly speaking, had been Lady Lester's idea. Little by little, from one and another, she had found out about the strange likeness; and Pomona had told her about her meeting with the painter, this Mr Ludlow, who did not take her fancy, though Sage liked him so much. Pomona had thought that Martin's warning not to talk about Mr Ludlow had been a nervous fancy of the anxious, old servant; but certainly the subject did seem to excite Lady Lester most unaccountably, and she so often recurred to it and questioned and cross-questioned the girl about the interview, that Pomona grew quite unhappy, and privately consulted the doctor as to whether undue excitement about trifles were ever a symptom in cases like her mother's, and was reassured by him that, in cases of great bodily prostration, the mind and nerves could not be expected to keep their usual steadiness, and that the only thing was to avoid agitating subjects as much as possible.

Mr Freestone, who came down frequently to Beechfield, and to whom she gave instructions as to the purchase of the picture, was inclined to think that illness was affecting her mind, in this sudden whim for the possession of a picture that she hardly seemed likely to live to see, and which she apparently had no particular wish to see either, as she directed that it should be taken to Park Lane and remain there till further orders.

'Well, one comfort is she can afford it; and

Miss Pomona will never miss it out of her big fortune; and if she did, she would be the first to wish that half the estate should go, rather than Lady Lester should be thwarted in her smallest wish.'

It was with the greatest relief and satisfaction that Lady Lester received Mr Freestone's letter announcing the purchase of the picture, and enclosing the agent's receipt; but two days later a telegram arrived which upset her terribly, and made Pomona declare that no telegrams in future should be taken to her. It was from Mr Freestone: 'Some difficulty about picture. Artist declines to sell, but hope to arrange the matter.'

'To which Lady Lester telegraphed in answer: 'Double the price if necessary.' A message over which Mr Freestone sighed and pondered deeply, considering how far it was right to carry out the wishes of a person clearly out of her mind.

When Owen Ludlow came back from Shingle, having despatched his telegram to his agent, bidding him, if possible, stop the sale of the picture, his mind was much more composed; and accordingly, he was much more observant, and Sage's dress, wet with the night-dew, and her wan little face, did not escape his notice, nor the nervous twisting and untwisting of her fingers, as she sat in the window with a bar of moonlight falling across her lap, where those tell-tale hands lay, while her face was carefully turned away from the glow of the red-shaded lamp on the table.

'The beggar's not coming,' Ludlow said to himself. 'Pon my word! it's too bad, and I shall tell him so, first chance.'

It was a little mortifying to Sage to find that, after her great self-control and composure, he should have remarked that there was something amiss; but still it made it easier to begin, and she said: 'I wanted to tell you that it is all over between me and Maurice—and,' going on quickly, in order to prevent what was likely to follow the sudden angry movement of Ludlow's arm and the laying down of his pipe—'and I think it is quite the best; and I quite agree with him.'

'May I ask the reasons, if there are any?'

'Yes; but you must not ask like that. You must be very kind to your little friend, for, though it is quite right, it is a little bit hard.'

'Yes, dear, tell me.'

'I have really known it all along,' she said; 'but he has only just found it out, that it is folly going on with this engagement of ours, when there is no prospect of any end to it. You see, he cannot get any situation that would enable him to marry, though several have turned up that would not have been so bad if he were not married.—Dishonourable? Hush! you must not dare to call him that, not to me.—You did not really mean it. It is my happiness he is considering all along, and he is quite right, for I should be miserable if he were not happy. If I had been like Pomona.—Oh! Mr Ludlow, I have never envied her before, but I can't help feeling it now. All that beautiful place and everything—I don't care about it for myself; but if I could have given it all to him—and I think I could have made him happy.' And here the poor, little voice, that had quavered and choked more than once, broke down utterly.

She was sobbing hysterically now ; and he got up and paced up and down the room, angry with Maurice, pitying her, bitterly blaming himself.

Presently, when she was calmer, she got up and came to where he stood, at the other window, moodily gazing out into the night. She had dried her eyes and even managed a little pitiful smile, that was more pathetic than her tears.

'You must not be angry with him,' she said ; 'it is quite right. It is just as much my doing as his. I think if he had not written to put an end to it, I should have done it. I am going to write to father to-morrow and tell him. I think he will be glad. I don't think he ever really liked Maurice. I've got father and Kitty and the boys still -and you,' she added shyly, holding out her hand. 'You will still be my friend.'

P I M E N T O.

EVERY one must be familiar with the spice whose black grains, large as duck-shot, are known indifferently by the names of Pimento, Allspice, and Jamaica Pepper. This spice is the dried berry of a tree, the Pimento, found in the island of Jamaica, where it grows naturally to the height of some twenty or even thirty feet ; and it is from Jamaica that the whole of the allspice put annually on the markets of England and the Continent is exported. Though a native of Jamaica, the pimento is not found distributed throughout the island ; it refuses to grow upon the lower coast-lands, and only comes to its greatest development on the mountains that occupy the interior of the island and slope away to the sea. The northern parish known as St Ann is the chief district of the pimento cultivation, forty thousand of the ninety-five thousand acres there cultivated being returned as devoted to pimento. Another species of pimento, known specifically as *acris*, is also a native of Jamaica, and from the leaves of this tree the aromatic principle of the well-known bay-rum is extracted ; but its cultivation has for some reason or other been neglected by the colonists.

The cultivation of the pimento exhibits some remarkable differences from that of other spices. In the first place, it has not been found possible to rear healthy plants from the seeds, and were it not that nature came to the help of the grower in this respect, the output of spice must, as soon as the present trees became old and unproductive, diminish and at length cease. Whatever may be the reason -and it does not seem that any one has taken the trouble to seriously seek for it—it is a fact, as many experiments have demonstrated, that seeds planted in the ordinary way produce only weakly plants, which, when they have arrived at the age when one might expect them to produce fruit, are either barren or bear only a meagre crop of berries. No greater success attends the attempt to increase the stock by means of slips ; and so fully have these facts been proved, that no grower endeavours to rear his own plants, but leaves the work to the birds that throng the trees when the seeds are ripening.

One has only to see the numerous seedlings springing up throughout the pimento groves to acknowledge the wisdom of this course. In this

way, the original plantations, or 'walks,' as they are called, were established, and at the present time, when it is desired to stock land with pimento, the following plan is adopted. The ground, chiefly forest, having been chosen, a party of wood-cutters is employed to fell the huge trees, whose trunks are left lying where they fall as a protection to the young plants that will spring up by the beneficent action of nature. The smaller growth of bush and the limbs of the trees are gathered together and burnt, their ashes forming a manure. The land, thus cleaned, is planted with provisions, and being virgin soil, yields a bountiful return of yams, cocos, and plantains. After the lapse of some months, one may see springing from the soil in different places the young pimento plants with their fresh green heads of aromatic leaves. Care must now be taken to keep away the cattle from the young plantation, until, indeed, the trees have grown sufficiently to put their foliage beyond the reach of the cows' teeth, as the temptation the spicy leaves offer is one not to be resisted, and a bite is generally fatal to any further development of the plant. After two or three crops of provisions have been taken from the soil, further cultivation ceases, and the short grass which only awaits its opportunity soon grows thick and sweet over the place where once the forest giants flourished. In two or three years, the pimento plants have grown sufficiently to allow of the pasturing of the cattle in the walk, and for the future the pimento grower has only to keep the ever-springing bush cut away, and to gather in August what crops the seasons send him.

Owing to the haphazard way in which the trees have been planted, one must not expect regularity in their disposition in the walks, and, as a fact, they are seen gathered into clumps, or scattered singly about the narrow valleys or swelling hill-sides, and not arranged in rows, as in other forms of cultivation. Mingled with the pimento, however, are the oranges, the prolific Seville and the sweet variety, limes, lemons, and other fruit-trees ; not to mention those forest trees that have been saved to give shelter to the cattle ; and the general view of a walk from some neighbouring hill is wonderfully effective by reason of the diversity of foliage. Perhaps the best time to visit the plantations is when the pimento throws out its blooms ; then each tree is wreathed with masses of pale white flowers, whose fragrance spreads far and wide, and reminds one vividly of the poet's words :

Sabean odours from the spicy shore
Of Araby the blest.

Around the sweet flowers hum thousands of small wood-bees ; and a million tiny insects crawl and creep among the petals, offering a rich feast to the humming-birds and other insect feeders. Too short, however, is the period of feasting ; for in a few days the tiny petals curl and wither, and fall in a white cloud to the earth as each breath of wind stirs the leaves. The walk loses its interest until the berries have swollen and are fit to be gathered.

In August, if the weather has been propitious, and if no storm or hurricane has swept the trees of either blossom or fruit, the pimento grower prepares to gather in his harvest. Early in the

week he gives notice to his headman that on the following Monday 'pimento-picking' will commence; and straightway word is sent to the surrounding villages. As a rule, each property has its own work-people, who live in the neighbourhood and work upon the plantation throughout the year; and it is to these that the grower looks for help in harvest-time. But if the property is large, or if the spice-berries are ripening quickly under a hot sun—for they must be gathered just before they turn black—it may be necessary to summon additional pickers. These are easily got; for the work is not heavy and the pay good. As they are paid by results—that is, on the amount picked—every man brings his wife and any children he may have able to pull the spice from the stem, and in this way the weekly earnings of a family may be considerable, considering the rate of wage of the country.

Early on Monday morning the gang of pickers will have gathered before the owner's house. Grouped together as they usually are, they form to a stranger rather a picturesque assembly—the men in shirt and trousers, with their formidable 'machetes' or cutlasses tucked under their arms, or stuck into the ground before them; and the women and girls in red and white turbans, with their garments looped up around the waist, so as to give greater freedom to the feet in walking. Each party is well supplied with large open bamboo baskets, the inevitable black iron pot for cooking, and calabashes or gourds for carrying water from the house into the walks. Large, coarse bags, in which to bring home the spice, are served out by the owner; and presently the whole company have scattered to their work. Their method of gathering the pimento is simple. One of each party of pickers, generally a lad—though the women and girls frequently perform this part of the work—climbs the trees, breaks off the heavily-laden branches, and drops them to the ground. If he is expeditious and skilful in his work, the 'breaker' will not take a long time to strip a tree of its spice, leaving it, from the loss of the branches, in rather a ragged condition. It is his business to keep the pickers constantly supplied; and as soon as he has 'broken' a tree, he descends, and carries the great bundle of branches to where they sit with their baskets before them. Immediately on receiving the spice, they proceed to take branch after branch in the left hand, while with the right they pull the round berries from their stems and let them fall into the baskets. In this way a practised picker will gather some seventy pounds of the green berries in the day, provided, however, the season be early and the pimento plentiful. On some properties, a different method of separating the spice from the branches is adopted, but this is only when a careful supervision over the workpeople is not exercised. A sheet is spread upon the ground, and the negro, grasping the branch in one hand, thrashes off the berries with a small stick, thus gathering a greater amount, as compared with the other method, but at the same time bruising the skin of the berry by his blows, and consequently reducing its market value.

As it is found that pruning the pimento is followed by serious consequences to the tree, in that the branch cut invariably dies back to the

main stem, which, however, does not occur when the branches are broken, the annual gathering of the spice not only relieves the tree of the burden of its fruit, but leaves it in a condition to put forth in a short time new shoots. As a confirmation of this statement, it may be mentioned that in the year following a poor crop, when the trees have not been extensively broken, the yield is far less than ordinarily, presumably because the trees have not been pruned in the process of gathering the pimento.

The scene in the walks when the picking is in full swing is both curious and interesting. As one rides through, the different parties of pickers may be seen, each sitting in a semicircle at the foot of some tree, busily occupied with their work. Not far off is a fire, over which is bubbling the iron pot containing the mid-day meal of vegetables; and at times one of the party leaves his work to attend to it. In the midst of a shaking pimento-tree, the 'breaker' is seen snapping off the branches of spice and throwing them to the ground, where they fall lightly by reason of the leaves attached to them. If the tree be young, and he dare not risk his limbs upon it, he has a long crooked stick, by which he can easily bring the bunches within reach of his arm. There is usually much chatter and laughter, for the negro is merry hearted; and if the spice be plentiful, he can reckon upon making a good day's wage. Towards evening, when already the sun has nearly dipped behind the forest hills, the negroes begin to return from the walks, the men bearing the heavy bags of spice upon their heads, the women the baskets, and the children the iron pot, the calabashes, or other belongings of the family. The scene of interest is now transferred to the barbecues—those great stone terraces on which the coffee and pimento are dried. Up the steep steps struggle the heavily laden men, and throw their burdens with a thud upon the barbecue. Now commences the work of measuring the quantity gathered by each negro. A flour-barrel has about one-third of its length sawn off and the ends removed, and this serves as the accepted measure. Being filled with the green and black berries, it is lifted up, leaving a heap of spice on the barbecue. This is a half-barrel, but the remainder of the barrel is also used as a measure, and is termed the quarter-barrel. When each picker has had his spice measured, a ticket is given to him indicating the amount he has earned; and on Thursday evening he exchanges this ticket for money.

For some days before the commencement of the picking, the barbecue-man—generally an old negro whose active days on the plantation are about over—has been busy making 'rakes' or brooms of the fan-palm, or in sweeping clean the terraces for the reception of the produce. And now that the first day's gathering is on the barbecues, he proceeds to spread out the pimento with his solid rakes until it covers the smooth surface to the depth of an inch. The whole area of the barbecues, frequently extensive, is divided by low ridges of stonework into terraces of varying extent, and connected with one another by openings in the stonework divisions. As fresh supplies of spice come in from the walks, the several divisions get quickly filled, since the gathering of one day is not mixed with that of

another until the whole crop has been cured. Under the burning sun of the tropics, the berries soon change colour; in one day they will have turned from a pale yellow-green to a light straw tint; and the barbecue-man is kept busy as the curing proceeds in turning them over with his rakes. He does this in the following manner: starting at one end of the long terrace, he pushes his rake before him down the length of the pimento spread out on it, so that there is formed a wide furrow, at the bottom of which the grains are thinly spread, while at each end of the rake as it moves a ridge is formed. As soon as he has completed one furrow, he repeats the process, commencing now from the end he has reached, and so continues until the whole surface is furrowed over. By frequent 'scoring,' as the process is termed, it is arranged that all the spice receives the full benefit of the sun's rays; and in six or seven days—or even earlier, if the sky has been cloudless—the colour of the pimento will have turned to a dull brown, its soft skin will have hardened to a leathery coat, and the stem dropped from the seed. By taking up a handful and shaking it at his ear, the grower can tell by the rattling of the kernels within the husk that the spice is cured, and he then puts it into bags to await the winnowing.

As the spice grows darker and darker and the end of the curing approaches, the anxieties of the grower and barbecue-man begin. Let but a shower of rain wet the nearly cured pimento and the value is at once depreciated, since it becomes mouldy; and no degree of attention afterwards will rectify the error. Hence, at the approach of rain—he can hear it falling far away in the forest, or see it rolling rapidly in a thin gray mist down the distant hills—the barbecue-man raises a shout, and at once the whole household is in movement. The grooms leave their horses, the cook her pots and pans; the other house-servants come fleeing out of doors; the owner and his family and the visitors run to lend their aid, carrying with them any brooms or brushes they may have caught up in their haste. Soon the barbecue seems to be alive, there is such a sweeping and raking of pimento, and bringing of palm-leaves and tarpaulins and boards—such a bustle and commotion to beat the weather. The rain is sweeping down the hills opposite; now it is in the valley beneath; two or three large drops are pattering down upon the heads of the workers. But the hard work is to be rewarded; the brown grains have been swept into a conical heap within the circular ridge in the centre of the barbecue, the tarpaulins are spread, then over these the palm fronds, and last the boards to keep all in place. Let the rain come; it can do no harm now. And it does come, racing across the broad terraces until they seem to smoke with the mist that rises from them: while the spouts of the gutters are shooting the water far out from the wall. For a good ten minutes the downpour lasts, and then passes on, and goes roaring across the far-stretching forest beyond. The sun breaks forth, and nature, refreshed by her bath, smiles once more; but the pimento so hardly saved is not uncovered that afternoon.

When the crop is cured, nothing remains to be done but to winnow and send it down to the

port. The winnowing or 'fauning' is done in a machine of American construction, in which the pimento passes through two or three sets of sieves, and is subjected meanwhile to a current of air directed upon it by a revolving fan. By this means the small unmarketable seeds, the stems and bits of plaster from the barbecues, are separated out; the clean spice is then packed in bags and sent away.

The price obtained at present for the produce is on the average about twopence-halfpenny per pound, and shows a great decrease upon that paid in years past. Unfortunately, there is every indication that a further fall is imminent, and in such a case it will no longer be profitable to gather the spice. All this seems to point to the fact that the taste of the public has changed with respect to spices, or at least that some other spice has taken the place in popular favour of the once favourite allspice. Still, about ~~one~~ and a half million pounds are annually exported from the colony, the value of which is estimated at one hundred and three thousand pounds sterling. Pimento thus holds the fifth place of importance in the exports of the island, being exceeded in value only by sugar, rum, coffee, and fruit; but one must feel regret that an ancient source of revenue to the colonists—for pimento has been exported almost since the occupation of the island by the English—should be in danger of ceasing altogether.

LESS THAN KIN.

CHAPTER III.

'WHAT on earth does he mean?' cried Ena, as soon as the sounds of that stormy exit had died away. Until that moment, neither of the two whom Wakelin had left behind had spoken.

The vicar threw back his still handsome head, and answered with a sort of fiery dignity which would have satisfied the greatest sceptic of his guiltlessness. As to Ena, however, she needed no such assurance: 'He means that I stole, actually stole, that abominable money! I!'

'My dear father!' with incredulous surprise.

'Yes; it is an absurd charge!' So absurd, indeed, that now he could actually laugh at the remembrance of it, the excitement of the moment leaving no room for apprehension of any consequences which might ensue. 'I am not sure whether I may not even find myself compelled to prosecute the man for slander. I must take a lawyer's opinion upon that.—Who did you say, by the way, wanted me down-stairs?'

The girl displayed a card, which she had been all the time twisting between her fingers. But she looked grave. Perhaps a prevision of the dangers ahead had come to her more quickly than to the vicar, in his indignant exaltation of spirit.

'Only a Mr Daintry. "Marmaduke Daintry,"' she read aloud, absently. Then: 'But how wicked of Mr Wakelin to utter such words! Suppose Jane or any one had overheard them!'

'They'll have every chance in future, I imagine,' somewhat grimly, as the angry sparkle in his eyes slowly faded. 'But Mr Daintry! Why— Of course I'll go to him. Surely,

surely it can never be Jack come to life again after all these years.' In the curious agitation caused by this second shock, following so quickly upon the first, such an occurrence seemed almost credible, and he never noticed the difference in the Christian names.

It was, however, a person altogether unlike the tall, genial lad whom he so well remembered as his boyish playmate, and equally unlike the gray-haired, stalwart individual into whom time might have transformed that familiar friend, who turned from examining a photograph of Ena as the vicar entered the drawing-room. And Mr Russell actually started as he beheld a rather stout, dapper, remarkably well-dressed man of about thirty coming quickly forward, with a look of the utmost ease and self-possession, to return his host's greeting.

'Of course you don't know me? How should you?' the guest exclaimed heartily. 'Never set eyes on me before. And yet I hear that you have a cousin of mine in your own house, treated as your daughter! Awfully good of you, really! Can I see her at once?'

His mingled calm assurance and eager presumption almost took Mr Russell's breath away. For many a long day he had scarcely even remembered the facts of Ena's birth, or thought of her in any different light from that in which she regarded herself—as his own eldest daughter. No marvel, then, that, instead of speaking, he simply stared. But Marmaduke was fully equal to that trifling embarrassment.

'Don't wonder you're surprised. Never was more so myself than yesterday, when Sir George's—my grandfather he was, you understand—will was read, and I found out that such a person as my cousin existed and flourished. Lawyers explained, and seemed quite up in the subject. But I'd never heard a syllable about her, not a syllable, I assure you! Frightfully bad form of the old boy to let her sponge on you all these years, whilst he kept me in the dark too, and then to leave her every stiver he could alienate from the estate, don't you know?'

Gradually dawn was breaking upon the clergyman's brain, almost stunned as it had been by two successive blows.

'Sir George Daintry is dead, then?' he managed to insert between the last sentence and that which he could see already hovering upon his companion's lips.

'A week ago; and quite time too. Oh, beg pardon,' with a laugh, both amused and heartless.

'Really, he was so specially ill-tempered'—

'De mortuis'—began Mr Russell solemnly.

'Oh yes! Very wrong of me. But to return to Ena. I've come as quickly as trains would bring me, to see her, and fetch her home. My mother says that of course it's the only thing. Proper sphere, and all that, don't you know?'

Evidently delicacy was not the gentleman's strong point. But it was a lack upon which Mr Russell did not feel himself called again to comment. Instead, he asked a question, or tried to do so.

'Your father'—

'Died when I was a shaver. He was Sir George's eldest son, don't you know? and owing to this clearance, I'm the head of the family now,' drawing himself up to his full, though

not very imposing, height of five feet six. 'Ah no! Title isn't on my card,' observing Mr Russell's glance. 'Haven't had time to have fresh ones printed yet. So much to do, you see. And that reminds me—mustn't dawdle here all day. By the way, I ought to have a letter for you somewhere. The lawyers fancied you might want credentials or such sort of rot. Though, naturally, I said that was rubbish.'

The signature of the note which he finally produced and handed over to its owner happened to be known to the vicar as that of a most respectable firm of London solicitors; whilst its wording was plain enough to dispel any doubts as to the bearer's identity, as well as with regard to his news of Ena's fortune. Before Mr Russell had reached the close of the few curt, business-like lines, he understood how completely altered were the prospects of the girl who had been to him as a daughter; and in spite of an aching in his heart at the idea of what this change must mean for Mildred and himself, had made up his mind how to act.

'Are you aware that Ena is in utter ignorance of her parentage?' he said, addressing the Baronet, who, too restless to stand still, had during the short silence wandered off again in the direction of the piano, and was diligently examining the music scattered about its lid.

'Is she? Oh, well, that's soon put right. Let me try the effect of three sentences,' with another laugh. 'See here: "Ena, my dear," I should tell her, "I'm your cousin, Sir Marmaduke Daintry; and your name is the same as my own. You're a rich woman too, and must"— Eh, what?'

'I was trying to intimate,' with some sarcasm, 'that I cannot allow that method of proceeding. Though you appear unable to comprehend its possibility, it is a fact that the intelligence that she is not my child, and is without natural claim upon my wife's love, will come as a terrible grief to Ena. Therefore, I must choose my own time and mode for explaining matters both to her and to Mrs Russell.'

Only by dint of indomitable perseverance did the clergyman succeed in getting so far. Four times at least his audience had sought to interrupt; now he was to be kept in check no longer.

'Oh, but really, don't you know? I can't consent to this. Grief to hear that she's an heiress, and cousin to a Baronet? Bosh! my dear sir, bosh! Had too much to do with women to credit that!'

'Where has he been brought up?' was the unuttered thought in Charles Russell's mind. 'One expects some gentlemanly feeling and behaviour from a man of his standing. But this is a regular bear.' Aloud, however, he merely responded, with cold dignity sufficient to quell even Joseph Wakelin: 'I have told you my fixed decision.'

Sir Marmaduke shrugged his shoulders. He could scarcely object further to the wishes of the man who for twenty years had carried out a duty which of right should have been undertaken by his own neglectful family. Yet the resolute words angered him. 'Then am I not to see her at all?'—gruffly.

'Not to-day. Should you be at liberty in a week's time to return, we shall be happy to

receive you. Possibly, if in the meantime Mrs Russell has heard from your mother, you may be able to persuade Ena to visit your home and make the acquaintance of your people. I do not wish to keep her from those to whom she stands in such near relationship. But'—

'Ah, just so! I understand,' throwing off the sullenness which had for a moment clouded his features. 'The mater wanted to write before, but I said where was the need for ceremony between relatives? This day week, then, for Ena. Afterwards, she and I, don't you know? may have a good deal to do with each other. Good-bye, good-bye.'

And absolutely before Mr Russell had quite grasped the meaning of that final hint and smiling nod, the man was in the hall, through the door, and out upon the pavement of the street. When, however, at length the laudable intentions of the Baronet did make themselves plain to the vicar, he smiled. 'Fortunately, we can trust Ena's taste,' he muttered, half aloud. 'But what will she and Mildred say to such a parting as this may involve?'

That was a problem very speedily to be tested, for, as he stood there pondering it, the door of the dining-room unclosed, and the sound of women's voices in earnest conversation reached his ears. In another second his wife and their adopted daughter entered together.

So entirely had the latter interview driven away for the moment all remembrance of that which had immediately preceded it, that he looked at the two grave, troubled countenances with wonder. Could they have overheard? Did they guess? But Mildred's exclamation immediately enlightened him.

'Oh, my dearest!' she cried, coming close up to him and throwing her two arms round him, as though to shield the man she loved from all trouble, 'how dared Wakelin say such an awful thing?'

It was one of her husband's characteristics that though he could be and often was spiritless and moody without any particular reason, real grief and anxiety had a tendency—at least in the first moments of trial—to brace him to meet the burden with courage. Often as it fell to Mildred's lot to support him under protracted worry or in imaginary woes, his was the stronger soul at such times as the present. And now he stooped smilingly to kiss the upturned face, passing one arm tenderly about her waist as he did so.

'My darling, don't worry yourself; it will all come right,' he answered. 'I am confident that the money will even yet turn up. If not, we must make it good.'

'But your reputation,' urged the wife. 'A clergyman is so at the mercy of people. One breath of scandal and he is ruined for ever!'

It was too true, and he recognised the fact. Yet he still smiled.

'Milly, this isn't worthy of you. My dearest, remember that I am innocent, and that, therefore, my reputation has a better Guardian than myself. As I said to Ena a little while ago, if necessary I should not hesitate to bring an action for slander against Wakelin, and that would, I am convinced, abundantly clear me.'

'Only it was so unlucky that you should have

paid Clarke! And then, too, you specially told Wakelin to let you have gold, not a cheque, for I happened to hear you speaking of it to him in the hall. Everything is against you!'

Charles Russell sighed. In the first excitement and anger with which he had met the charge, he had not estimated the force of these details, as now, for the first time, he was conscious of doing.

'Well, if necessary, we must confess the truth, love, and humble our pride to own that your single gold bracelet afforded the ways and means of pacifying Clarke! As to the cheque, now that I have closed my banking account cheques are most awkward matters to manipulate. Only last month I was vowing never to accept another for any large amount.'

'If only other people can be induced to see and understand as we do!'

He had seldom beheld his wife so overwhelmed. And all the time he was conscious of another trial for her lurking in the background, acquaintance with which could scarcely be postponed. Mr Russell's heart felt heavy as lead.

'We must trust that they will,' he answered, with a cheerfulness he certainly did not feel. 'But, my dear, there is something I have learned to-day which I must tell you. No, Ena, don't go. It concerns you almost more than it does ourselves.'

How the intelligence was finally broken perhaps none of the three ever exactly knew. To watch the look of pain deepening in Ena's eyes as he unfolded his tale, to feel the heaving of Mildred's bosom as he pressed her to his side, and still to be obliged to continue his story, made that hour one of the hardest in Charles Russell's not very easy life. But the words were uttered at last. Ena had been made to comprehend that though the love which had always surrounded her still remained, her claim upon it had vanished. She saw herself, rich indeed in the public esteem, but deprived by one stroke of father, mother, sister, and brother. And the whole of the little world in which hitherto the girl had lived and moved seemed suddenly to be split and rent to its foundations. With a sobbing cry, she sank down on her knees before Mildred, who was sitting on the couch, and buried her face in that familiar lap. A poor consolation seemed the promised fortune for all that she was losing! 'Oh, mother, mother,' she wailed, 'don't desert me like this!' Such an entreaty could meet with but one response. In another moment she was resting on the same breast where, long ago, she had wept out her woes, and Mildred's tears mingled themselves with her own.

'My sweet child, we shall never desert you. Your father left you to us, and we have always loved you. Do you think anything could separate us now?' she whispered reassuringly; whilst her husband took a short walk to the window, and then brushed his handkerchief two or three times across his face before applying it, with ostentation, to its more legitimate use.

'And just as Dick is on the way home, too. Oh, mother, what will Dick say?'

Mildred shook her head. 'Poor Dick! It will be a sad return for him altogether, I'm afraid. Troubles never come singly; but to-day has brought more than its share, I do think.'

'Though one can quite suppose that some people, with more sense than we've got, might regard Ena's legacy as a mitigating circumstance,' spoke up Mr Russell from his station across the room. But notwithstanding the rallery, he did not turn his head, or for the moment expose his own countenance to inspection.

'Legacy! What's a legacy?' from the ungrateful recipient. 'Who can suppose that money would make up for all that this has taken from me? Oh dad, you will care for me still?'

And so the scene went on, until gradually they had talked themselves into at least a partial realisation of the state of the case, and some slight resignation to its obligations.

'For that you ought to accept Mrs Daintry's invitation, and visit her, there's no doubt,' the vicar declared.

'Mrs Daintry? Oh, the Baronet's mother. What a trial for her to miss being my lady,' remarked Ena with a laugh, which, though but the ghost of her usual gay ripple, at least told of returning spirits. 'And how do you like Sir Marmaduke, father? You did not mention that.'

A difficult question to answer with combined truth and civility to the absent. Happily, however, whilst he hesitated, Mr Russell was spared the need for reply. With a fling the drawing-room door was thrown open, and Bijou danced in, dragging a tall, well-set-up young man by one hand, and sending her announcements ahead in her shrillest tones. 'It's Dick,' she screamed. 'I was digging weeds up in my garden, and found him, and he's come home to stay. He says so!'

Even Ena's troubles and Joseph Wakelin's suspicions were forgotten in the delight of that meeting and greeting. And Dick's protest that he wasn't a weed himself, whatever Bijou might consider him, was smothered in his mother's embrace.

• SOME EARLY LONDON CONCERTS.

THE modern lover of music has such plentiful fare provided for him well nigh every day of the year, that it is difficult to realise how comparatively recent is the great growth of concerts and musical entertainments of all kinds with which we are now so familiar. The pedigree of the London public Concert can be traced back to the later half of the seventeenth century. Before that period, private concerts were given from time to time by different members of the nobility; but the people generally had little opportunity of indulging a taste for high-class music, and had for the most part to be satisfied with entertainments given in public-houses by performers hired by the landlords. Sir John Hawkins tells us how in places like these 'half-a-dozen of fiddlers would scrape Sellenger's (or St Leger's) Round, or "Old Simon the King," with divisions, till themselves and their audience were tired; after which as many players on the hautboy would in the most harsh and discordant tones grate forth "Green Sleeves," "Yellow Stockings," "Gillian of Croy-

don," or some such common dance tune; and the people thought it fair music.'

Public concerts owe their direct encouragement to John Banister, who had won fame by his playing on the violin, and who succeeded the celebrated Baltzar as leader of Charles II.'s band of twenty-four violins. Pepys, in an entry in his Diary for February 1667, tells us the court gossip of the day—'how the kings viallin Bannister is mad that the king hath a Frenchman come to be chief of some part of the kings musique.' It was rumoured that he was dismissed the royal service for saying that English violins were better than the French—a statement which was no doubt regarded as heretical, opposed as it was to the prevailing court view as to the superiority of France in all questions of taste, and especially with regard to music. Banister's concerts, at the close of the year 1672, were advertised in the 'London Gazette' as follows: 'These are to give notice that at Mr John Banister's, house (now called the Musick School), over against the George Tavern in White Fryers, the present Monday will be musick performed by excellent masters, beginning precisely at four of the clock in the afternoon, and every afternoon for the future precisely at the same hour.' Four years later on, we read again: 'At the Academy in Little Lincoln's Inn Fields will begin the first part of the Parley of Instruments, composed by Mr John Banister.' The admission was at this time as a rule one shilling; and these concerts seem to have been held pretty regularly down to within a short time of Banister's death, which took place in 1679.

Another person who did much to promote a taste for music was Thomas Britton, better known as the 'Small-coal man,' who gathered a circle of music-lovers around him at this period in his unpretentious home in Clerkenwell. Among his guests were Woolaston the painter and Hughes the poet, as well as Dr Pepusch and Handel, who at this time had still his fame to make. To these weekly concerts, held in a long narrow room over his shop, the poet tells us that Apollo

Led his train,
And Music warbled in her sweetest strain—

the train including the beautiful Duchess of Queensberry.

More important than Britton's musical club was the founding in 1710 of the Academy of Ancient Music, for the practice of ancient vocal and instrumental music. This association was formed at the 'Crown and Anchor Tavern' in the Strand, under the direction of Dr Pepusch, the gentlemen and boys of St Paul's and the Chapel Royal taking part in the performances. The Academy had the honour of performing Handel's 'Esther,' the members appearing dressed in character; and its success is said to have led Handel to consider the desirability of establishing oratorio performances at Covent Garden. Fashionable society was at this period divided into factions, which grew out

of the rivalry of Handel and Bononcini, concerning which Byron wrote the well-known lines :

Strange that such difference should be
'Twixt Tweedledum and Tweedledee.

The unfair ban, however, under which Handel was placed, was not shared in by the king and queen ; and a story is told of Lord Chesterfield leaving the empty theatre, in which an oratorio was being sung before the king, and giving as his reason that he did not desire to intrude on the privacy of his sovereign.

The oratorio—invented in the middle of the sixteenth century by St Philip Neri, as a counter-attraction to the theatre—was first made popular in this country by the author of the 'Messiah.' As organist to the Chapel of the Duke of Chandos at Canon's he was the first to introduce organ concerts, and did much to recall sacred music from the neglect into which it had fallen in England. St Paul's Churchyard was then a centre to which music-lovers gathered, and many of the neighbouring shops were famous for their musical instruments, temptingly exposed to the view of those who attended the services of the cathedral, held twice every day. The meeting of so many musicians in this vicinity led to the establishment of regular concerts at the 'Queen's Head Tavern,' under a certain Talbot Young. Later on, they were held at 'The Castle Tun,' and won a certain amount of fame under the style of 'Castle Concerts.' This tavern had once been kept by Shakespeare's friend and fellow-actor, the comedian, Richard Tarleton, and was situated near the famous 'Dolly's Chop-house,' in Paternoster Row. The old 'Tun' perished in the Great Fire, but was afterwards rebuilt, and in the new building the 'Castle Society of Music' gave their performances, assisted by some of the vocal talent of the operas.

Benefit concerts seem to have been given from time to time at the various theatres, one given by Signor Carbonelli, a celebrated violin-player, and pupil of Corelli, took place at Drury Lane in May 1722, its programme, which was divided into three 'acts,' including 'a New Concerto for Two Trumpets,' 'a Song by Mrs Barbier,' 'a New Concerto by Albinoni, just brought over ;' and a solo on the arch-lute by Signor Veber—a selection which shows the prominence of Italy at this time in all things musical, Carbonelli having been brought to England by his patron, the first Duke of Rutland.

An amusing concert bill of the time of Queen Anne, which has been preserved, enables us to form a good idea of the kind of entertainment then provided for the general public. The programme consisted of music, several opera songs, 'pleasant Dialogues and Commical Dances.' These dances, which were all to be represented in 'Habits according to the Fashions of the Countries,' included sketches of 'an Irishwoman,' 'a Spaniard and his Lady,' 'a French Peasant and his Wife in wooden shoes,' as well as 'Two Hugonots.'

The songs began patriotically with the 'Genius of England ;' the sombre character of 'O Land me in some Peaceful Gloom,' being followed by the brighter strains of 'Let all be Gay.' In those days of amorous swains and dainty shepherdesses, the song of 'Cynthia now is cruel grown' and 'Strephon the Bright' must have found a re-echoing response in the breasts of the Corydons and Strephons present. The Dialogues seem to have been quite in the spirit of the Christmas pantomime, including 'Since Times are so Bad'—apparently no novel theme, even in those days—and 'Oh! my Poor Husband,' irresistibly appealing to all married folk. This performance, which resembles a variety entertainment rather than a concert, lasted from six in the evening until nine ; and the price of seats was 'an English shilling the pitt ;' and an 'English sixpence the upper seats.'

Vauxhall was now coming into prominence with its al-fresco concerts, for which the celebrated Dr Arne, the author of 'Rule Britannia,' composed many of his best-known songs. Even in the days of Charles II. it seems to have been a place of popular entertainment, for Pepys tells us that he went 'by water to Fox Hall, and there walked in Spring Garden: But to hear the nightingale and other birds, and here fiddlers, and there a harp, and here a Jew's trump, and here laughing, and there fine people walking, is mighty diverting.'

Ranelagh, too, was opened for evening concerts in the summer of 1742, when Beard was the principal singer, and Festing led the band. It was here, about twenty years later, that an infant prodigy, no other than the eight-year-old Mozart, performed on the harpsichord and organ several pieces of his own composition for the benefit of a charity.

The Madrigal Society and 'the Noblemen and Gentlemen's Catch Club' date from this period—the Catch Club holding dinners at the 'Thatched House Tavern' every Tuesday from February to June, when 'canons, catches, and glees' were performed by the members, prominent among whom at one time was George IV. This club celebrated its centenary in 1861.

More important, however, in the history of English art is the establishment of the 'Concerts of Ancient Music,' an idea originally suggested by the Earl of Sandwich : and it was out of this Society that the famous Handel Commemoration arose in 1784. Though it held its first season in rooms in Tottenham Street, it is with the Hanover Square Rooms that the history of the Society is most intimately connected, for it was here that Catalani made her first appearance, as well as Miss Stephens, who afterwards became Countess of Essex. Up to the close of the last century, however, the concerts were held in the rooms in Tottenham Street ; and for a few years in the concert room of the Opera House, before becoming permanently established in Hanover Square at the commencement of the present century. The Hanover Square Rooms were for some time carried on by Sir John Gallini—who had taught the children of George III. to dance—after a similar fashion to the rival establishment of Mrs Cornely's in Soho Square. Masquerades, 'festivos,' assemblies, and so forth, alternated

with more serious musical productions. The Rooms were first opened with a concert given by Charles Abel and John Christian Bach, who continued for several years to entertain the musical world here; while later on 'The Professional Concerts' were rivalled by those of Salomon the violinist, at which Haydn in the 'closing years' of the last century conducted his twelve 'grand' symphonies. Here, too, John Braham was introduced to the public as a tenor singer.

Meanwhile, the ancient concerts were patronised by royalty, and George III. would constantly show his interest in them by writing out the programmes of the performances with his own hand. Often, accompanied by Queen Charlotte, he was present at the Hanover Square Rooms, and is said to have had a chamber added to the side, called the 'Queen's Tea Room,' to which he presented a large gilt looking-glass. A special feature of these concerts was the total exclusion of all modern music, the pieces selected for performance having to be at least twenty-five years old.

While lovers of high-class music were being thus well catered for, we can catch a glimpse of the sort of fare provided for the mass of the population from a work by George Alexander Stevens, published in 1761, called the 'Adventures of a Speculatist, or a Journey through London.' An entertainment seems to have been then common under the style of *Comus' Court*, which appears to have contained the germ of the future music-hall. 'We went,' he tells us, 'to *Comus' Court*, as they call it—one Jack Speed's White Horse, Fetter Lane. These meetings were on the same plan as Sadler's Wells, where people might sit and smoke and drink, and hear singing, and see all the posture-makers and tumblers, yet only pay so much for liquor, and have all these comical fancies into the bargain. One plays with a rolling-pin upon a salt-box, another grunts like a hog, and a third makes his teeth chatter like a monkey.'

Much pleasanter must it have been to have heard Tenducci sing at Ranelagh, or Joseph Vernon at Vauxhall.

To revert to the ancient concerts—in the closing years of the last century two famous singers lent a brightness to these performances: Mrs Billington, who appears as St Cecilia on the canvas of Sir Joshua Reynolds; and Madame Mara, whose great merits were first fully appreciated in the Handel Commemoration at Westminster Abbey. Meanwhile, the Academy of Ancient Music closed its career in 1792. There was no dearth of good music, however, for Harrison and Knyvett had just set on foot the Vocal Concerts; and a little later on Mrs Billington, Braham, and Signor Naldi delighted audiences at Willis's Rooms; while Madame Catalani competed for popular favour in Hanover Square. In 1813 was established that still flourishing Society, the Philharmonic, whose concerts became associated later on with the Rooms in Hanover Square. The last concert held in these time-honoured Rooms was given in the year 1874; and the Club of to-day must be haunted by the musical echoes of many a bygone performance. Thus the opening years of the present century found the system of concert-giving firmly established; and the appreciation

for this class of entertainment has been ever since growing, as the enthusiasm of a St James's Hall audience can testify as far as London is concerned.

THE WINNING OF PADDON MANOR.

IN TWO CHAPTERS.—CHAP. I.

ON a bright morning of April 1813, I, Joseph Smerdon, mariner, stepped ashore on Dartmouth quay with as heavy a heart under my shag waistcoat as any man carried that day in Devonshire. You may judge if there were not reason for this, when I tell you that three weeks before I had been first-mate of an Indian called the 'Arcot,' having in her hold a venture of my own which must have brought five hundred pounds at least, and now this had vanished away.

Seven years had gone since I last saw England, much less my native place, which was Teignmouth. In that time I had voyaged the Indies up and down, in country ships for the most part, making here a little and there a little by trading on my own account. In 1811 I was master of a transport, when General Auchmuty went to Java, and happening to do some service there, when I returned to Calcutta the gentlemen of the company recommended me to the captain of the 'Arcot,' whose first-mate had died of the cholera-morbus. Of the voyage home there is no need to tell; but, alas! whether through fog, or misreckoning, or premature rejoicing, or all three, a March morning—luckily, a calm one—found us hard and fast on the rocks between Ushant and the Cape Finistère. This was in the days when we were at war with France, and the French *chasse-marées* were not long in finding us out, and consigning us to dismal 'chokey' (as we say) in Brest. But at that time a great number of honest fellows from our west country were free of the French coast, and willing to be of service to people detained against their wills in France or England; and so it happened that the 'Polly' of Dartmouth left Roscoff with Joseph Smerdon in her hold, as well as fifty tubs of cogniac, and a grievous smell of stale sprats, to deceive inquisitive noses.

But if a man is no more than forty-two, and a sailor used to ups and downs, a dinner such as I had at a tavern near the Butter Walk, and a quart of ale with it, puts a different look on things. And after all, I might have been much worse off; for my sea-boots, so old and worn that the Frenchmen thought them not worth taking, had stowed in their linings over a hundred gold mohurs, worth each a guinea and a half. So that I was provided against want for many months, as I reflected with satisfaction, sitting in the parlour window and looking out on the river, and the craft straining at their anchors in a strong ebb-tide, the green hills winding away to Dittisham, and the old gray castle on guard at the mouth.

Now, that you may understand my story, I must tell you something of my belongings. I was born and bred in Teignmouth; and my father was a royal-navy man, boatswain of the 'Oxford' at the time of his death. My mother had a brother named Jonathan Westcott, a

small shipbuilder at Teignmouth, who was good enough to allow me to make myself useful about the yard; and in due time I was apprenticed to him, till, my indentures being out and having no money to set up with, I took to the sea, and found my trade of good service to me.

Now, my uncle was not, I believe, a bad sort of man, and gave me no more cuffs and rope-ends than is necessary to make a boy stick to his work. But he loved money as well as any banian trader, and, as is always the case, this grew stronger every year. He took a hand in smuggling ventures, like most people there, and owned two ketches, carrying clay and moorstone sometimes as far as London. But the year before I left him, his prosperity seemed to increase, and no one could tell how. He had always lent money; but now he lent more, and he bought the 'Unity,' as nice a lugger as ever cleared her cost in two runs to Roscoff. Her skipper was one John Bickford, an Exmouth man, and whenever he was in port he would visit my uncle, and they would sit over their rummers till sometimes my uncle would have to be carried to bed.

That afternoon I bought shore-going clothes, of which I stood greatly in need, and then began to think of the best way to reach Teignmouth. A boat, of course, would have suited me best; but I could find none going there, and had no mind to charter one. The road by Tor Bay and St Mary-church was a bad one, and I resolved to take passage next morning in a boat going to Totnes; and so by the highway to Newton-Bushel and down Teign side—some fifteen miles in all. So I embarked early; and we went swiftly up with the flood-tide, while I smoked a pipe and watched the river wind and turn among the hills, and the woods breaking into young green; and the air of my native land was sweeter than ever after the stinks and fevers of the Indies for so many years. And when we came to the ancient town of Totnes, I landed at the bridge, and set my face for Newton, without other baggage than my gold and a good oak staff, such as we called a 'Plymouth cloak.'

I found Devonshire hills at first somewhat trying to my calves, after such long absence; but I knew where a mile or more might be saved by a right of way through the Paddon estate, belonging to Squire Hilliard. I found the stepping-stones on the bank, got over, and having crossed one field, rested at a stile to smoke. Just as I had seated myself, I turned my head, and beheld Squire Hilliard himself, a stern and active man of fifty, a terror to poachers and vagrants, coming towards me like Giant Despair whom I used to read of, and two keepers with him. I stood up and raised my hat, and he seemed astonished.

'Fellow,' he said, 'what are you doing trespassing here?'

'Your worship,' I answered, 'it is no trespass. This is a right of way, acknowledged this forty years, for the use of people going on their lawful occasions.'

'Ha!' he replied—'a sea-lawyer, it seems. And who may you be, and what is your lawful occasion, as you call it?'

'I am a sailor,' I said, 'as your honour sees—Joseph Smerdon by name, lately escaped from

the French, and going to Teignmouth to visit my uncle, Westcott the shipbuilder.'

'Indeed,' he said. 'Then you had best be going, for it is a long way. Give my respects to your worthy uncle, if he be yours, and tell him to drink less rum and more water.' With these words he went on his way, and I on mine, wondering why he should care if my uncle drank or not. But this meeting recalled to me that Squire Hilliard and my uncle were indeed acquainted, and the strange manner of their becoming so.

Two-and-twenty years before, Squire Hilliard had acquired Paddon, not by purchase or inheritance, but by winning it on a wager from a gentleman named Rendell. Squire Rendell was the wealthier of the two, for he owned Paddon, and another place called Darleigh, near Ashburton; while Squire Hilliard's land, Utcombe by name, was at Bovey-Tracey. Now, it chanced as they followed the hounds one day, Squire Rendell and his horse fell into a deep pool of Teign, and were got out with much trouble. At the hunting dinner that evening there was laughter at his expense, which so vexed him, that, having much wine aboard, he laid a wager with Squire Hilliard, of Paddon Manor against Utcombe, which was worth far less, that they should swim their horses out into Tor Bay, the one who should first turn back to lose.

So on a calm day they and some of their friends rode down to the Tor Abbey sands, and the two gentlemen entered the sea, both horses and riders barebacked. My uncle, as a responsible kind of man, was at hand in a sailing-boat, and Jack Bickford with him, as well as two or three gentlemen, who were to be the umpires. They swam on bravely till about a cable's length from the shore, when Squire Rendell's horse, which was leading, was taken with a cramp, the water being bitter cold, and went down bows foremost, so that his rider was very near to be drowned, for he could swim but little. They brought him ashore with all speed, and recovered him, while my uncle and Bickford went out and fished up the horse with a creeper. No one expected that Squire Hilliard would hold his friend to the terms of the wager; but he did so, being, as was known, heavily in debt to people in London. So Paddon was made over to him; but all the gentry thereabouts looked coldly on him; and he had, as we say, himself to himself, turning from a wild young fellow into a hard and disagreeable man.

I reached Teignmouth late in the afternoon, rather tired and footsore, by reason of new shoes. Little or nothing seemed changed there, in the little crooked streets smelling of tar and fish, any more than the hills around were changed, or the broad Teign, with the boys picking cockles on the mud flats, or the great red bluff of the Ness; and my uncle's yard was there, with a fishing-smack hauled up for repair. I walked across to the little house with the green door and rapped on it. An old woman opened it, and I asked if Mr Westcott were within.

'Iss fai,' she answered, 'but martial busy. Do'ee want vor to spake to 'n partic'lar.'

'Tell him his nephew is here,' I said.

I heard the word nephew, followed by some

growling. Then she came back, saying: 'Plaze to step in, zar;' and I entered the little white-washed room, with a window like a porthole looking on the yard, which I knew so well.

My uncle sat at a deal table with pen and ink, and a raffle of papers before him. When I had last seen him, he was a hale man, under forty; but he was almost sixty now, white-haired, and leaner and more stooped than he should have been, though his eyes were yet keen and his face not much wrinkled.

'Tes you, Joe, come back,' he said, looking up. 'Well, you'm growed to a vine man. And how's zea zarved 'ee zince 'ee wur vule enough to take to it? Zame as it do zarve most volks?'

I told him of my late misadventure, and he began shaking his head sadly. 'Vive hundred pounds, Joe,' he said. 'Ay, that's a tarrable loss, if you'm spaken the truth. Haven't 'ee got nothin' left?'

'Something I have yet,' I replied.—'But how is it with you?'

'Bad's the best, Joe,' he said. 'Trade be ari gone skat. The yard do pay about wages, and no more. If 'twasn't vor vree trade and my zavins, I'd be to workhouse.—The "Unity"? Caught, Joe, long ago. Her's a revenue boat now; but Bickford's revenue too, chief-boatman to Exmouth. Her'll be here to-night.'

I did not set much store by this, knowing that he would have said the same if he had owned all the town; and I promised to come again later and tell him more. When I did so, I found John Bickford with him, a man of fifty, short and stout like a capstan, with a face hard and red as a lobster boiled, and a look of exceeding honesty.

I told them some foreign experiences, to their great admiration, and showed a sample of what I had with me, at which they, as old hands at concealments, were amused. But at the middle of the second tumbler I observed: 'I forgot, uncle, a message for you that I was charged with to-day.'

'A message,' said my uncle. 'Who vrom, Joe?'

'From Squire Hilliard,' I said; 'and his word was, that you were to drink less rum.'

I saw the two look at each other, and Bickford said: 'Ay, a careful man he be now, not like when we knowed 'n vust along.'

'And Squire Rendell, how is he?' I asked.

'Died two year ago,' said my uncle; 'and his zon drowd up sojerin' and married. Zame as you maight do to the zea, Joe, if you'm a mind. There's Mrs Pearce, to Newton-Bushel—Kate Harvey that was—keep'th the "Bull Inn." A good place it be, but beyond a woman to manage; and if zo be's you can't pass what you'n got vor ten times zo much, 'twas vor nothin' you lived ten year with me and travelled the world vor twenty.'

It was clear that my uncle Westcott and his chum did not want to talk about the two Squires, for they turned it off in some such way whenever I would have inquired further. And this shows that a man may err as well in saying too little as too much, for I began to think that all was not right in that quarter. Then I retired to my lodgings; and Bickford, who seemed free of the house, to a room up-stairs.

In the morning I was up and about, and met some that knew me, and missed some I had known.

I did not forget to make further inquiries; and they told me that Squire Hilliard was no fonder of the neighbours than they of him, though reckoned an able magistrate. He was unmarried; and what company he had at Paddon was mostly people who had met him in London, where he sometimes went. But of the new Squire Rendell they could tell nothing. However, one thing I learned, that there was some sort of intelligence between my uncle and Squire Hilliard, who had been known to recommend him to people who wanted money.

My most pressing business just now being to change my Indian gold into guineas, I walked to Newton-Bushel, and the Plymouth coach took me to Exeter, where the money-changers were astonished at finding a seaman unwilling to be cheated. As I got down from the coach at Newton on my return, I perceived the 'Bull Inn,' of which my uncle had spoken. I walked into the bar and rapped on the counter. Nobody came; but at the back of the house I heard a woman's voice in anger, and a man's using very bad words. I took the liberty to go round and enter the stable yard, where I found Mrs Pearce very flustered, and a hostler fellow very drunk and foul-mouthed, while two or three more stood by and gaped. Without more ceremony I kicked him out into the road, where he lay howling. Then I turned to Mrs Pearce, who was beginning to cry, and led her politely into the parlour.

'A dirty, vilthy, drunken baste,' she sobbed. 'Never was I carled such names avore, and in my own house. I'll hav'n to justice, zo I will.'

'Never mind, Kate,' I said. 'I did the like for you at Denbury Fair once.'

'Massy zave us! be it you, Joe?' she exclaimed. 'An' where have 'ee been this twenty year? I've got thicky bead necklace yet you bought me to Denbury.'

My former sweetheart was now a plump, dark-eyed woman of forty, with hardly a touch of gray in her curly black hair, though she said it was a wonder it was not white, with trouble and vexation. She had been a widow some two years, and well off, with no children; but, as she said, 'the trade were not vitty vor a lone woman.' In short, before I took my leave, promising to come again speedily, I saw that the 'Bull' and all it contained were mine for the asking without any question of money. Mrs Pearce would not hear of my walking back the six miles, but the spring-cart must be got ready. Whilst waiting for this, a lady and gentleman on horseback stopped directly opposite the window to speak with some one on the footpath.

'Squire Rendell an' his new-mar'd wife,' said Mrs Pearce. 'Baint'm a handsome pair, Joe? Miss Lavis o' Chudleigh, she were, an' reckoned the best-lookin' maid in the county.'

'Not half what you were at her age, Kate,' I said. But this was a piece of poetry on my part, for the lady was truly handsome, not above two-and-twenty, tall and slim-waisted, yet firm and strong of figure, in her close riding-dress; in feature rather Spanish than English, as many are in our parts. But when I looked at her husband, I was amazed, for I knew him well, though I had never suspected who he was.

I have said that when we took Java I was master of a brig carrying troops. Now, in that

affair the Batavia fever and arrack wrought so upon our men that almost one-third of the force was unfit for duty, and a call was made for volunteers. I took the best of my men; and at the attack on the Dutch lines we worked a gun, as the General said, excellently well; and were not behind at the storming or in the enemy's camp. But though there was good fighting that day, none did better than Captain Rendell of the king's troops. He was the first man to enter the great redoubt, and ran through a gunner before he could put the linstock to a piece laid directly on our men. His sword—made by Government from hog'shead hoops—broke short, and a vile native, like a crushed wasp, ran a kris into his leg; but he caught up a rammer, brained one Dutchman therewith, and kept the rest at bay till a musket-shot brought him down. I was there as they carried him to the surgeons, and heard his name; but it is a common one in our parts, and I thought no more than that he had well upheld the honour of Devon.

All the way back in the spring-cart, which jolted so for all its springs that I would as lief have walked, I had much to think upon as to how I should shape my course. But reflecting on how I had lost the gains of years of danger in an hour, and Kate declaring that a sailor's wife was no more than another man's widow, in a month's time Captain Smerdon, as I had a right to call myself, after the command of the transport, was landlord of the 'Bull,' and had introduced discipline there, which was all that was wanted, Kate knowing, as we say, all the ropes.

My uncle was not present at our wedding, being laid up with rheumatism; but as soon as he was about again, he came over to Newton and stayed with us for the night. We gave him a most excellent dinner as well as supper, and he did more than justice to them. But he being used only to spare living, the consequence was that Kate woke me that night, declaring that she heard thieves in the house. I took a candle and a cutlass and went out, but found no one. Hearing, however, steps in my uncle's room, which was next ours, I went in, and perceived him standing in his nightgear fast asleep, but with his eyes wide open. I would have gone out again and made the door fast, lest he should fall down the stairs, but at that minute he spoke.

'Cut'n away, Jr x,' he said; 'don't 'ee lave a shred of 'n.' Then, after some mumbling: 'Three veet under, it must be, Jack.'

I knew that when a man is like this he will often answer questions, so I imitated Bickford's voice, who I knew must be 'Jack.'

'Why not your veet, zur?' I said.

'What a vule 'ee must be, Jack,' he answered. 'Water be too thick to see in, an' three veet deep'll catch 's knees so nice as may be.'

I nearly let fall the candle, as it flashed into my head what he was talking of; but before I could think of what to ask next, he spoke again. 'Iss zure, Squire,' he said, 'but vor cash down. Her deserv'th it vor the like of such vulishness.'

At this minute, Kate, wondering what I was about, opened the door hastily and upset a chair with a tin rushlight stand upon it. My uncle woke up, and seeing me stand there, with a

drawn cutlass, shouted 'Thieves!' and 'Murder!' till the whole house was aroused. I was so angry, that I could scarce trust myself to speak to Kate, and the rest of the night did nothing but kick and toss about.

For I saw clearly that in a few minutes more I should have learnt the whole of a vile conspiracy, planned by Squire Hilliard, and carried out by my respectable uncle and the honest Bickford, to rob Squire Rendell's father of his lands. This much I guessed, that the horse had not failed by reason of cramp, as was supposed, but from entanglement in a net or something of the sort laid there by them; and that my uncle had received a sum of money for this, which accounted for his sudden prosperity. But of this I had not a scrap of evidence or a word of writing to show, though goodness only knew what it might be worth to me if I could be the means of restoring Squire Rendell to his estate of Paddon.

But luck stood my friend, and in a way I least expected. Our business had begun to improve greatly, so that old Hawke of the 'World,' where the coaches stopped, grew jealous, and threw out nasty hints to the excisemen that I, as a sailor and my uncle's nephew, knew where to get good liquor cheap. So at last one day, as they came prying about my cellars, one of them, an impudent fellow named Curtia, said to me: 'I've had news for you, captain.'

'Have you so?' I said. 'Then out with it, Mr Gauger, and let's have it over.'

'Why, that precious pal of your uncle Westcott's,' he answered, 'Jack Bickford, the chief-boatman to Exmouth, has been bowled out at last. 'Pon my oath, I believe the fellow had good interest somewhere to keep h's place, for he's been hand-in-glove with the mugglers all along. But they found out that it was through him the whole force went on a wildgoose chase to Beer Head while a cargo was run at Starcross; so he's safe in Exeter jail, waiting for 'sizes.'

'Serve him right,' I said, 'for being a traitor to His Majesty.—But it will make no difference to me, whatever you may please to think.'

But it made a good deal of difference, for I saw that this was the time for a bold stroke, now that Master Jack was laid by the heels and could not get away. So the next morning the coach set me down in Exeter; and a crown to the turnkeys admitted me to that part of the jail where the prisoners not yet tried were kept.

THE 'MERMAID' AT THE ZOO.

VISITORS to the London Zoological Gardens should pay their respects to the most interesting of the many recent acquisitions, which is a young Manatee. This animal arrived in London in company with its mother; but she, poor beast, being bulky and short of breath, succumbed very soon to the frequent changes of conveyance which she had to put up with in order to get her to the Regent's Park. Weighing about half a ton, and being without the least capability of progressing on dry land, it is no wonder that the transport of the animal was a matter of the greatest possible difficulty both to her and her

conductors. The young Manatee, however, is well worth a visit; it is one of the most interesting animals in existence, and is, furthermore, not to be seen every day. It is true that the Zoological Society have had three or four Manatees in the last twenty years, but there has not been one on view for at least three years.

The Manatee shares with the Dugong of the eastern seas the distinction of being the only living representative of a group of animals which were once more plentiful. We find skeletons of extinct Manatees; and within the last hundred years, perhaps even more recently, a third member of the order, the Rhytina, has faded into extinction. This latter animal was, in point of size at any rate, a much superior beast to the Manatee, for it appears to have measured thirty-five feet of so in length; but, like many giants, it was of a peaceful not to say stupid disposition; and it had, moreover, no teeth to help it in convincing others of its right to continued existence; therefore, it ceased to exist. Very possibly, both the Manatee and the Dugong will follow in its departing footsteps, for they, too, are defenceless creatures, though they certainly have teeth; but these teeth are blunt and broad—useful for chewing the cud, but not to be relied upon for offensive purposes.

The great disadvantage under which the Manatee labours is its defectiveness of brain; the organ is small, and its surface is smooth, instead of being thrown into those folds, or convolutions, as they are more technically termed, which argue intelligence. In the long run, too, brain is more effective than muscle, even among animals.

In spite, however, of its intellectual defects, the Manatee has adopted a mode of life which will probably result in a longer lease of life to the species than if it had proved itself incapable of this alteration. We find the two species frequenting the rivers which flow into the tropical parts of the Atlantic; they occur, that is to say, in Africa and in America and the West Indies. The fact that they inhabit both sides of the ocean leads to the inference that they were once purely marine beasts; this assumption is of course strengthened by the fact that we meet with their remains in marine strata, rocks that have once formed part of the bottom of an ocean. So many marine creatures can also live in fresh water—the salmon is the most obvious instance—that it is not in the least surprising that the Manatee should have determined to change its habits. Now, this course of action must have been a move in the right direction, from, at any rate, one point of view. While grazing peacefully at the bottom of the sea, the Manatee would be liable to be interrupted by sharks and other carnivorous creatures of the deep, with which it would be entirely unable to cope. Such foes would be less abundant in rivers.

Why the Manatee, or the Dugong, should have—as some people think it has—given rise to the Mermaid notion is hard to understand; it would need, we should think, many additional rations

of grog to induce a sailor to make a detailed comparison between the shapeless, black, and bulky Sirenian and a damsel terminating in a fish. As has been suggested, 'Merpig' would be a more suitable name, though the Manatee indeed has not got the 'in'ards of a Christian,' as the pig is always said to have; its interior is constructed more on the plan of that of a cow, and, like that animal, the Manatee has a complicated stomach suitable to a vegetable diet. Its chief internal feature, however, is its enormous lungs; no doubt, these are contrived a double debt to pay, like the swim-bladders of certain fish. It is quite possible, from the habits of the animal, that it uses its lungs not only for breathing purposes, but also, when inflated, to enable it to rise to the surface of the water.

The Sirenian, as the Manatee and the Dugong are technically named, are, roughly speaking, hoofed animals, which have taken permanently to the water, just as the seals, and probably the whales, are carnivorous animals which have adopted a similar mode of life; and it is highly interesting to note that in both cases a certain amount of modification along precisely the same lines has taken place: in all these groups of animals, the hands—and the feet, if they are present—have become more like a fish's fin, while the whole body has assumed a form like that of a fish. In the whales and the Sirenians, the hind-limbs have almost completely vanished, leaving only the most inconspicuous traces of themselves. From this, one would argue that the whales and Sirenians have been much longer aquatic in their habits than the seals. The very first lesson that the student of zoology learns is not to judge by appearances; otherwise, the Manatee would be undoubtedly put down as a near relation of the seal, or perhaps even a fish.

CHRISTMAS-TIDE.

'A MERRY Christmas!' How the old words waken
A thrill and throb for many a Christmas fled,
For hopes fulfilled not, that the years have taken
Into their keeping, like the tears ye shed.

'A merry Christmas!' Let the happy chorus
Bring a new thrill, new freedom, new delight;
Past pain makes present joy but sweeter for us,
E'en as the dawn of morning after night.

'A merry Christmas!' Be ye thankful ever
For friendship that is left warm, sure, and strong,
For love that fills your hearts with high endeavour.
Live life anew. Ye do the Past no wrong.

'A merry Christmas!' Life has halting-places,
Where ye may pause in all the busy strife
To comfort those whose sorrow-stricken faces
Tell their own story in the book of life.

'A merry Christmas!' Raise on high the holly,
With spirits leaping at the sound of mirth,
Far nobler than all sorrow is your folly
That sheds 'good-will' and gladness o'er the earth.

LANDMARKS OF A LITERARY LIFE.

FIFTY-TWO years ago a young English lady with literary aspirations sent to Messrs W. & R. Chambers, Edinburgh, a prose article and a poem, which she had the pleasure of seeing inserted shortly afterwards in *Chambers's Journal*. The lady was Miss Camilla Toulmin, who afterwards became Mrs Crosland, and her name a generation ago was as well known to the reading public as those of Miss Edna Lyall and Miss Annie Swan are to the readers of to-day. The connection which Miss Toulmin thus formed with this *Journal* has continued from 1841 to the present day, though our gifted and respected contributor is now eighty-one years of age. Her early association with the Messrs Chambers soon developed into personal intimacy, and when on visits to London, the brothers were in the habit of calling upon her, and thus a close and lifelong friendship was established between them. In 1845 she spent nearly two months in Scotland as the guest of one or other of the two brothers, and in her volume of reminiscences now published (*Landmarks of a Literary Life*, 1820-1892. London: Sampson Low, 1893) she gives graphic and interesting sketches of what she heard and saw when in their society. She visited Peebles with William Chambers, where he and his wife had summer lodgings; drove thither in beautiful July weather by the Pentlands and the Moorfoot Hills; slept for the first time in her life in a 'box-bed'; visited Manor Valley to see the cottage of bowed Davie Ritchie, the prototype of Scott's Black Dwarf; went down the Tweed and saw Abbotsford; and was taken about to the many places of antique and historical interest in and around the little ancient burgh itself. Also in their company she visited the Trosachs, Loch Katrine, Loch Lomond, and Glasgow. While a guest in Robert Chambers's house she met 'Delta' and others of the Edinburgh literary celebrities of the day. She tells some interesting anecdotes of the early life of the two brothers, which she had from the lips

of William himself, but these we need not reproduce here.

To return, however, and begin at the beginning. Mrs Crosland was born (we presume in London) in 1812, and her earliest recollection—a wonderful instance of precocious memory—refers to a period when she was little over three years of age. This was the reception in London in June 1815 of the news of the battle of Waterloo. She relates what she had often heard her mother speak of afterwards, and what in these modern days of psychical research would have been deemed worthy of note. The news of the battle did not reach London till the evening of Tuesday the 20th June; but on the previous Sunday evening—the day of the battle—her mother was seated on a balcony of their house until past ten o'clock. 'She declared she saw in the clouds images of horses galloping, mostly with riders, but some, she said, riderless. From her description she implied that the phantasmagoria lasted more than a quarter of an hour. Of course, when the news of the battle reached London, the coincidence was thought extraordinary; but so many people smiled at what they evidently supposed fancy or delusion, that, in later years, she grew cautious as to whom she related the incident.' 'I believe, however,' the writer adds, 'she learned that one or two other persons had a similar experience that evening.'

On the Tuesday evening following, when news of the battle actually reached London, her parents were present at a weekly whist club to which they belonged, and the whist-players were in full enjoyment of their game when they were startled by the newsmen's horns, and the cries of 'A great victory—Buonaparty defeated!' and 'Courier!' 'The cards were thrown down—the gentlemen rushed into the street to procure the paper at any price the newsmen asked. The details were comparatively meagre, yet they were ample enough to convey some idea of the victory gained, and to break up the party, sending home several medical men who were present, and who intended to proceed to Brussels, and make arrangements to despatch medical students with-

out delay. The ladies also departed, for their task was to be up early to look out all the old linen they could find, and set themselves to work to make lint for the wounded.'

About 1838, when twenty-six years of age, Mrs Crosland—we call her so for convenience' sake, though she was not married until ten years later—seems to have begun to contribute to some of the leading annuals. These were still the days of 'Keepsakes,' and 'Friendship's Offerings,' and 'Books of Beauty'—a kind of publication long obsolete, and now only occasionally to be found in the cheapest rows of the second-hand book-shops. But good writers contributed to them—Scott, Thackeray, Disraeli, Ruskin, and many others who had names in the literary world. Some of these annuals paid their contributors well—Sir Walter Scott having received four hundred guineas for a short story which he wrote for the 'Keepsake.' In 1838, the 'Book of Beauty' was edited by that now almost forgotten author and woman of fashion, Lady Blessington, who accepted several poems by Mrs Crosland. The latter also 'wrote up' to engravings, as was generally the method of supplying the letterpress which accompanied these plates. The letterpress was required to illustrate the plates, not the plates the letterpress. Readers of 'Arthur Pendennis' will remember how Thackeray represents his hero as producing the beautiful poem, 'The Church Porch,' to meet the wants of a particular illustration sent him.

In the 'forties,' Mrs Crosland made the acquaintance, among other literary celebrities of the time, of Mr and Mrs S. C. Hall, and relates many interesting episodes in their lives as revealed to her while in association with them. Also Dinah Maria Mulock, afterwards Mrs Craik, author of 'John Halifax, Gentleman'—a novel which has retained its popularity in a marvellous manner. It was in 1842, at the table of Lough the sculptor, that Mrs Crosland had her first introduction to Robert Browning and Leigh Hunt. Browning, she says, was then a young man; 'but Leigh Hunt was the important guest, whom every one else was invited to meet.' So runs round the whirligig of time! She had no particular admiration for Leigh Hunt, but still was curious to see a man who, for at least a generation, had been prominently before the literary world. He played the Sir Oracle that evening, and harangued rather than conversed. 'He dwells in my memory as a thick-set man of nearly sixty, with fine dark eyes and whitened hair, with his portly person encased in a white waistcoat, which was amply displayed by his habit of throwing back the lapels of his coat and inserting his thumbs in the armholes of the waistcoat. In this attitude, and leaning back in his chair, he discoursed to what for the most part seemed an admiring audience. I must confess that he seemed to me the very type of self-satisfied vulgarity: a man without reverence, and consequently without the breadth of understanding which reverence gives.' 'Robert Browning, whom years afterwards I had the privilege to know well, spoke comparatively little that evening; but I was struck with the quiet dignity of his deportment, and his expression of commanding intelligence.'

The friendship of Douglas Jerrold was also one of Mrs Crosland's acquisitions in those years. She spent an afternoon in his house at the time the Candle Lectures were appearing in *Punch*. 'Towards the close of the meal a packet arrived—proofs, I fancy—at any rate Douglas Jerrold opened a letter which visibly disturbed him. 'Hark at this,' he said, after a little while; and then he proceeded to read a really pathetic, though not very well expressed letter from an aggrieved matron, who appealed to him to discontinue or modify the Candle Lectures. She declared they were bringing discord into families, and making a multitude of women miserable. I believe the letter to which I allude gave Douglas Jerrold great pain.' Mrs Crosland is of opinion that while Jerrold had the reputation of a wit, his witticisms bordered too nearly on tiresome punning to be of the first order. 'For example, on inquiring in society, about the year 1854, who a certain gentleman was, he was told, "Mr Mills, from Manchester." "Indeed," he promptly replied; "why, I thought all the mills had stopped there."'

To leave literary reminiscences aside for a moment, we have a very interesting notice of the famous engineer, the elder Brunel, the designer and constructor of the Thames Tunnel, through which thousands of our readers must have passed. The tunnel has long been overshadowed by greater engineering feats; but at the time of its construction it was regarded as a really great enterprise. The work was begun in 1825, and the tunnel was opened in 1843. Sir Isambard Brunel and his wife were old when Mrs Crosland knew them; but Lady Brunel told her of their way of life during the years when the tunnel works were in operation. 'They resided near the shaft at Rotherhithe, and, through day and night, every two hours a sample of the earth excavated was submitted to Brunel for his examination; and in accordance with its character were the instructions given for the next two hours of work. Writing materials were always ready in his bedroom at night, and a bell was so hung as to ring near the bed. There was also a lift by which the sample of soil ascended, and by which, in return, the letter of instructions was conveyed. This broken rest was at first a great trial; but, after a while, the habit of awaking every two hours was formed, and Lady Brunel declared that for months after the completion of the tunnel she and her husband found it impossible to sleep for more than that period at a time.'

In the summer of 1845, Mrs Crosland made the acquaintance of Mary Howitt. The former was long past the age and the inexperience of those who imagine that authors and authoresses should look different from other people, yet her first impression of Mrs Howitt was one of mild surprise at finding that lady such an exceedingly motherly sort of personage. She was of medium height, rather stout, with prominent features, slightly projecting teeth, and hair already gray, though she was not yet fifty. There was also about her a stamp of provincialism which she never quite lost. Her husband, William Howitt, was a very agreeable man if you agreed with his opinions, but was essentially pugnacious, with deeply rooted prejudices. Mrs Crosland

ventures to think that his wife must have required all her amiability to get along with him as well as she apparently did. The same thing has been said of Mr and Mrs Carlyle; but these rank among the higher interests of the literary world. Of Mr and Mrs Howitt, possibly not half-a-dozen persons will now think twice.

Among the American authors whom Mrs Crosland knew was Nathaniel Hawthorne. This was in 1854. She describes him as in the mid-prime of life, a stalwart man, with blue eyes rather small for the size of his head, but having a peculiarly soft impression. In society, she says, 'he was one of the most painfully shy men I ever knew. I never had the privilege of an unbroken tête-à-tête with him, and am under the impression that with a single listener he must have been a very interesting talker; but in the small social circle in which I first met him, it really seemed impossible to draw him out. We were only five or six intimate friends, sitting round the fire, and with a host remarkable for his geniality and tact; but Hawthorne fidgeted on the sofa, seemed really to have little to say, and almost resented the homage that was paid him.' He afterwards spent an evening in Mrs Crosland's own little cottage, and she observed him enter into an earnest conversation with Philip James Bailey, the author of 'Festus.' A dozen people were chattering round about them, but this did not interrupt their talk with each other; though, curiously enough, it was not till later on in the evening that each knew the other's name. Nathaniel and Bailey must here have discovered for themselves some elements in each other of a kindred spirit.

In the autumn of 1857, Mrs Crosland met Robert and Elizabeth Barrett Browning in Florence, and was received by them very kindly in the Casa Guidi. Robert Browning ushered her, on her first visit, through one or two apartments to the drawing-room, where she met Mrs Browning. The latter was a little below the middle height, and the loftiness and spaciousness of the room served to accentuate the fact, as she approached with 'that gliding movement' which is now gone out of fashion, but which in Mrs Crosland's young days used to be called 'swan-like.' 'Her abundant hair, falling in long thick ringlets, was of chestnut brown, and her eyes were of a similar hue, with a softness and sweetness of expression not possible to describe.' On the occasion of another visit, spiritualism was the subject of conversation, and Mrs Browning was anxious to borrow from Mrs Crosland a certain book on the subject. Mr Browning broke in, somewhat vehemently, begging her not to lend his wife the book, as he did not wish her mind to dwell on such things. 'I remember,' says Mrs Crosland, 'Mrs Browning exclaiming rather warmly, "Robert, my soul is my own!"—though, with wife-like obedience, she yielded.'

These 'Landmarks' of Mrs Crosland's which we have thus briefly brought under review, are full of interesting matter of various sorts; and though many of the lesser celebrities of whom she writes are no longer celebrated, and though much of their work has passed into the dust-bin of ephemeral literature, yet the story our old contributor has to tell is worth reading; and we are glad that in her old age she has succeeded

in placing before the world a book so pleasant and so attractive, and hope it will light up her remaining years with something like a fresh accession of literary popularity and prestige.

POMONA.*

CHAPTER XXIV.

So the dreams depart,
So the fading phantoms flee,
And the sharp reality
Now must act its part.

WESTWOOD.

'I AM going to London by the early train. I'll be back to-morrow.'

'Why are you going? Oh, Mr Ludlow, don't go!'

'It's not to see Moore; you needn't be afraid. I'll give you my word not to go near him. Keep a brave heart, little Sage.'

'Are you going to see father?'

'No; I think not.'

'And you are quite, quite sure it is not *him* you are going to see?'

'Quite sure. It's some other business I have to go up about.'

Meanwhile, the business on which Mr Ludlow was bound was not apparently to be accomplished in London, for he went straight across to Victoria Station, and had soon turned his back on the great metropolis, and was hurrying along that line of railway which Sage had seen in its spring loveliness the day she had thought she was the happiest girl in the world.

Owen Ludlow, artist as he was, did not observe any of the beauties of the way; perhaps it was because it was a sullen, lowering day with thunder-clouds heaping themselves up in the west.

'Is Lady Lester at home?' he asked the dignified butler, who, with the assistance of two footmen, opened the door to him.

'Her ladyship is seriously ill, and does not see any one.'

Now Sage, he remembered, had told him she was ill; but he had not reckoned on her being too ill to see him.

'Can I see Miss Lester?'

'Not at home.'

And nothing remained but to tender his card and turn away, with a flat sort of feeling of having got up the steam for nothing, and nerved himself to do something he hated, and which must be done at once if it were to be done at all.

He left the regular carriage road to try a pleasant-looking short-cut down a glade, at the end of which the water glimmered cool and bright. And who should he meet as he went down the glade but Pomona herself, walking slowly towards the house, with such a radiance on her face and sweet light in her eyes as Ludlow had never seen since he wooed her mother in those golden days so long ago? Why should she have that look, walking alone under the August foliage? Had some wood-spirit been breathing love in her ear? some sylvan god wooing her?

But Ludlow had no time for wondering, or even for admiring, for he had to gather his purpose together, which had got strangely demoralised

since he turned his back on the house, and to silence those objections, which had gained new force since he had given ear to their voices.

She did not see him till she was close to him, and then she started as if she had been waking from a dream, and she coloured a warm, soft flush over face and neck, as if suddenly aware of a strange eye reading her inmost secrets; and her eyes sank, as if conscious of being too full of light and happiness to meet any other eyes but those that had looked into them last, and set that light and love shining by his burning look.

Owen Ludlow raised his hat, and she bowed, and was passing on, when he said, 'Miss Lester; and she turned courteously.

'It is Mr Ludlow. You must forgive me, but I did not recognise you. Have you been to the house?'

'Yes. I came to see Lady Lester on some business; but I am sorry to find she is not well.'

'She is very ill,' said Pomona. 'But will you not come back and rest? And perhaps you could tell me anything you wish to say to my mother, unless you would rather see Mr Hilton, the steward, if it is any business matter. I hope,' she added hastily, 'there is nothing wrong with Sage?—She is not ill?'

'No,' he answered; 'I do not think she is ill; but she has had an anxious time of nursing little Kitty, and she is not very bright.'

'But Kitty is better?'

'Oh yes, Kitty is getting well; but Sage has another trouble, and if you'll allow me, I will tell you about it.'

They had reached the house now, and she led the way through the garden and in by the garden door to the pretty morning-room where Sage had thought she would have been contented to sit all day; and she rang for tea, and entertained him in gracious, hospitable fashion, that made it more difficult every moment to begin the business on which he came.

The touch of fine-lady formality which had struck him at their last meeting seemed all to have gone; the slight frost had melted under the golden summer that was reigning in her heart; she had forgotten her dislike to the painter, which had never been very deeply seated, but which had been altogether washed away by the deluge of her love for one. Why! she would have taken the whole world into her arms just then, so beautiful, bright and happy a planet did it appear, and so big her all-embracing love.

Ludlow watched and listened to her with a sort of fascination. As Sage had said, the likeness to the picture, and so also to the original of the picture, was less striking the longer you were with her; and in Katharine there had never been so much of that bright, vivid fullness of life that was so remarkable in Pomona; so the resemblance ceased to jar on him, as it had done that evening in the studio.

But the matter could not be delayed longer, for Pomona was saying: 'I do not want to hurry you; but I always go up to my mother at seven, and you said you would tell me about Sage.'

And then he began. He had rehearsed the story over and over again in the watches of the night before and through the journey, for he had determined, if Lady Lester could not or would

not see him, to tell Pomona herself. But no rehearsing would make the story run smoothly, or make it appear the least as it had looked twenty years before at the Orchards with the apple blossom dropping softly all round.

He did not mention any names, but described the tall lady coming, and his final consent to her having the child.

'You let the baby go?'

'Yes.' It was Katharine's voice asking the question, and he answered guiltily, without offering any excuse.

'Did you ever see her again?'

'Not for twenty years.'

'And then?'

'I met her again.'

There was deep silence in the room, so deep, that a blossom falling on the pavement in the conservatory was distinctly audible, and the ticking of the tiny watch in the bracelet on Pomona's wrist.

He did not dare to look up at her, or to speak, though the silence seemed more than he could endure, and to be lasting for an eternity.

At last she said, with an odd, stiff sound in her voice, as if it were an effort to articulate the words: 'I understand you to mean that the tall lady was'—

'Lady Lester.'

'And the baby?'

'You were the little baby.—Pomona'—he turned towards her with a sudden emotion quivering in every limb and making his voice hoarse and unsteady—'Pomona'—

But she held up her hand to silence him. 'Wait,' she said. 'I must try to understand. Have you any proof of this?'

'Ask Lady Lester.'

'That is just what I dare not do. She is so ill that the slightest agitation might kill her. I am thankful this miserable story did not reach my'— And then, with a sharp cry, as of bodily pain, she covered her face.—'If this story is true, she is not my mother!'

And then again, with a great effort, she composed herself, and went on: 'But there must be proof if it is true.'

'I have the letters; and if Lady Lester's maid, Martin, is still living, she knows the truth of the matter.'

'Martin too!' The girl wrung her hands together with a gesture of despair, that was so pitiful that Ludlow could almost have wished to declare his story a lie, if only to bring back the gladness into the girl's face.

'If this is true—mind, I only say if—I do not believe a word of it without proof; but if it is true, I am not Pomona Lester.'

He stretched out one hand to her in mute appeal; but she drew back almost with horror.

'I must have time to think it over,' she said. And then, with a poor, little attempt to reassume her usual gracious courtesy of manner: 'I do not mean to be impolite; but I must ask you to leave me to think over all this you have told me. You see, I have a good deal to think about, and I had better be alone. If you could come to-morrow morning, I should be more myself, and could hear anything you had to say further. If you have the letters you spoke of with you, perhaps you would let me see them.—Thanks.

I need not say I will take care of them; and if you can come to-morrow?'—

'Yes,' he said; 'I will be here any time that suits you. Shall it be ten?' And then, impulsively, he stretched out both hands to her. 'Pomona,' he said—'Pomona, if I can in any way make up to you—if a father's'—

'No,' she said, and her voice sounded cruelly cold and clear—'No, if this terrible thing is true, which God grant it is not! there never could be anything of father or daughter between us. When you gave your poor, little child away, I think that came to an end.'

And so they parted.

CHAPTER XXV.

Of love that never found his earthly close
What sequel? Streaming eyes and breaking hearts?
Or all the same as if it had not been?

TENNYSON.

It was a very hollow-eyed, changed Pomona who came down to meet Owen Ludlow next morning, and though yesterday you might have declared that most of her beauty consisted in the brilliant health and happiness in every line and tint, yet now, when the great eyes looked at you with dark circles of tearful watching round them, and the rose-tinted cheeks were white, and the lips wore a pitiful curve, she was no less beautiful; and there was a certain added dignity to her movements which perhaps had been hitherto too glad and girlish. And in the chill, gray, dawn, she had had a piteous, heart-breaking interview with poor, old Martin, who had crept in while her lady slept, to see what this sudden headache could mean, and the scared look in her young mistress's face.

She had stoutly denied at first all knowledge of the thing, and had grown angry, and scolded, till Pomona's hopes began to rise, when suddenly this broken reed, on which she was beginning to lean, collapsed, and Martin was kneeling at her feet sobbing, and confessing that it was all true, but imploring her not to say a word to her mother, as it would kill her.

She had had to comfort and soothe the poor old woman, and assure her that nothing should come to Lady Lester to agitate and harm her; and then, when she was alone again, she read the letters through once more, by the cold reasonable light of early dawn, with no longer even any hope that there was any mistake or delusion about it; and tried to think calmly of the change this would make in the future.

One thing was certain: Beechfield was hers no longer; it never had been hers. It was Sage Merridew's. She drew back the curtain and opened the window and leaned out; the sun was just rising behind the great beech avenue, under the broad shadows of which the deer couched in the dewy grass; down below, the lawn was white with the heavy moisture, and the soft fragrance of dewy roses mounted from the terrace. How beautiful it was! Perhaps Pomona had never fully realised its beauty till now, when it was hers no longer.

But there was some comfort still. On the table by her side was a little glass containing the small bunch of forget-me-nots she had worn at her belt the day before. They had flagged and drooped, but, with the usual power of recovery

in that flower, had revived in water, and now were as fresh as ever, the little blue flowers showing among the leaves as simple and sweet as children's eyes.

When those flowers had been picked and given to her, some one had said: 'My beautiful Pomona, if I could only prove my love! If this terrible wealth of yours did not come between us!' This was the comfort. With Maurice Moore at any rate, it would make no difference; or if it did, it would be a difference on the right side. It was not Pomona Lester, the rich heiress, he loved; without Beechfield and all its wealth, she would still be his beautiful Pomona, rich in his love.

And so, when she came down next morning to receive Owen Ludlow, though she was white and changed and hollow-eyed, she was not utterly prostrate; there was the little bunch of forget-me-nots in her belt, and a smile now and then on her grave lips and in her deep eyes.

Owen Ludlow had slept as little as she had; but wakeful nights and agitation do not leave so much mark in middle age as they do in youth, and he looked much the same as usual.

She handed the letters back to him as she entered the room, thereby avoiding the necessity of shaking hands as she bade him 'good-morning.'

'You have read them?' he asked.

'Yes; and I have also spoken to Martin. I fear there is little doubt of the truth of what you say.'

'I should not have spoken now'—he began.

But she stopped him. 'I am very glad you did. The terrible mistake has been not doing it sooner. I will not say a word of blame of my—Lady Lester; but a great wrong has been done Sage Merridew, and every day add to it.'

'It was on her account I came.'

'Does she know?'

'Not a word, and she need never know; only I thought'—

'Of course she will know. Do you think I would go on a day longer than I can help, taking her proper place, spending her money, wearing her jewels?' And hardly conscious what she was doing, suiting the action to the word, Pomona drew off, one by one, the rings from her fingers and unfastened the bracelet on her wrist. 'But I dare not tell my mother. And I have been thinking—if you will tell Sage—that it cannot—cannot be very long now—if she would wait till—it cannot be very long, and it will all be hers then.'

The girl's voice shook and broke, and in the silence that followed, Ludlow said: 'I want you to let me tell you about Sage, and why I made up my mind to come and speak to you.'

She made a little gesture to him to go on; her voice was not quite enough under control to speak.

'A week ago I should not have come. She was happy then. I don't know if she has ever mentioned her engagement to you? For the past six months she has been engaged to a young friend of mine, and there seemed every prospect of her happiness, for I believe he was sincerely attached to her. But within the last few days he has written to put an end to the engagement, and it is simply on the score of want of means. Sage, as you know, has no money, and he has

only a small allowance from his father, and has been trying vainly to get some small appointment which would enable them to marry. He says, and he is quite right, that it will be for the happiness of neither to marry into poverty, and so he set her free, and she is just breaking her heart about it.'

'Poor, little Sage!' Even in Pomona's great trouble she can pity Sage, as she lightly touches the flowers in her belt.

'I thought,' he went on, 'that if Lady Lester knew of this, she would not allow the child's happiness to be wrecked, and that, at anyrate, some share might be given her'—

'A share!' she interrupted, 'of what is all her own? But that will be all right now, but it cannot be quite directly. You will tell Sage, and she will tell him. There will be no need to part or break their hearts for want of means. Why did she not tell me about it? This—this friend of yours is, you say, sincerely attached to her?'

How strange women are! You never can reckon on them. There are so many unknown quantities to be taken into account in summing them up, and yet they have one thing in common, Ludlow thought—overpowering curiosity about love affairs. Who would have dreamed that, even in her great and evident distress of mind, Pomona should have cared to ask about Sage's lover? But then Ludlow did not know the meaning of that little bunch of forget-me-nots, or of the fellow-feeling that 'makes us wondrous kind.'

'Very sincerely. I am quite sure he feels this separation as much as she does, and nothing but the hopelessness of the engagement would ever have induced him to break it off.'

'You will tell her,' Pomona repeated, 'I would write to her myself, only I am much occupied with—Lady Lester. I am writing to-day to Mr Freestone, our—Lady Lester's solicitor, and I will ask him to arrange all the business matters as speedily as possible. Only, I am sure Sage will not press it while Lady Lester lives. It is only such a very, very short time to wait.'

She had risen as she spoke, as if to put an end to the interview; and he stood silent, looking at her, feeling miles away from her, utterly out of reach, helpless to comfort or advise, conscious that in the whole world he was the last she would turn to in her trouble. Father and daughter, and yet far apart as the Poles.

'Good-bye,' he said at last—'good-bye; and if ever'—

'Good-bye,' she interrupted quickly. 'You will tell Sage and your friend?'

'Yes,' he said; 'I will tell Sage and Maurice Moore.'

And then he turned to go out, but was stopped by a quick exclamation from Pomona.

'Who did you say? I beg your pardon. I did not quite hear.'

'Maurice Moore, my friend, to whom Sage has been engaged.—Good-bye.'

And then he went out, not knowing how his last words had given the cruellest stab of all to Pomona's heart.

'Is Miss Lester at home?' There was a glad assurance in the voice of the speaker, and a

forward movement, as if the answer were a matter of course, and there was no need of delay even to receive it.

But the man did not step aside to admit him, and the answer was so unexpected that Maurice Moore almost started on hearing it.

'Not at home.'

'Is she in the grounds?' Wondering to himself: 'Can I have missed her?—Had she come to meet me?'

'I think not, sir.'

'Is Lady Lester worse?'

'No; I believe her ladyship is much as usual.'

Maurice stared blankly at the man. What did it mean? But at that moment Pomona's maid came from the back of the hall, and Maurice's face brightened. A note? That was all right, and the first he had ever had from her; and he took the little packet and carried it away, to open when he got into that glade leading down to the water.

It did not take long to read. Inside there was a bunch of crushed forget-me-nots, and on the paper was written in Pomona's hand, 'For Sage Merridew.'

THE FLY COUNTRY.

IN a private letter from one of the pioneers of the British South Africa Company, the following passage occurs: 'We are all to be mounted; and it is taking the horses to certain death; we shall ride through the Fly Country till they die, and then foot it.'

Now, what is meant by this Fly Country, and why should it be especially fatal to horses? are questions of great interest, for they are intimately associated with the past and future of the Dark Continent. The fly referred to is that known as the Tsetse fly, which is thus described by the traveller Baines: 'The tsetse is little more than half an inch long, and rather more slender than a common house-fly. The abdomen is marked with transverse stripes of yellow and dark chestnut, fading towards the centre of the back, so as to give the idea of a yellow stripe along it; the belly, livid white; the eyes are purplish brown; and the wings, of dusky, glassy brown colours, slip one over the other, just as do the blades of a pair of scissors when closed, so that the tsetse at rest on man or animal may infallibly be known by this one token. It has six legs, and tufts of hair over its body; its proboscis, or piercing apparatus, is about one-sixth of an inch long; its sight and smell seem to be keen; its flight straight and rapid.' Here we have the picture of the most formidable opponent to the advance of civilised man in Africa; for wherever the country is unexplored, so that the big game remain undisturbed, there this deadly fly bars the way to those necessary animals the ox, the horse, and the dog, and reduces man to a beast of burden; for although, in the interior, donkeys and mules are supposed to be impervious to tsetse poison, on the coast they also often succumb to the deadly fluid injected by 'the fly.'

Livingstone describes and figures the tsetse with its lancet-like proboscis much magnified.

He says: 'The poison does not seem to be injected by a sting, or by ova placed beneath the skin; for when the insect is allowed to feed freely on the hand, it inserts the middle prong, of three portions, into which the proboscis divides, somewhat deeply into the true skin. It then draws the prong out a little way, and it assumes a crimson colour as the mandibles come into brisk operation. The previously shrunken belly swells out; and if left undisturbed, the fly quietly departs when it is full. A slight itching irritation follows the bite.'

Wild animals and the goat feel no more serious effect from the sting than man, and even calves are exempt as long as they continue to suck the cows; but dogs cannot be protected by being fed on milk. The effect of the poison on oxen and horses is most curious; they do not die at once, and indeed the symptoms do not appear for some days; but then the nose and eyes begin to run, the coat gets rough, a swelling appears under the jaw, and emaciation commences, to be inevitably followed by death, although, perhaps, not for months, the effects of the poison being hastened, however, by rain and sudden changes of temperature. Singular, indeed, is the effect of the bite, or, as the Boers call it, the 'stick' of this fly; for the carcass when examined is found to be almost bloodless; the cellular tissue under the skin is distended with air, resembling a number of soap bubbles; the fat is yellowish-green and oily; the heart so soft that the fingers can be made to meet through it; the lungs and liver are diseased; the stomach and bowels are pale and empty; and the gall bladder is distended with bile. Yet, as Livingstone says, wild animals nearly akin to the horse and ox, such as the buffalo and zebra, suffer no harm; neither do pigs, goats, and wild antelopes; but dogs suffer as severely as horses and oxen. The skin of an animal which has died from the tsetse shows all the punctures on the inside, with a ring of yellow mucus on the flesh beneath each puncture as large as the palm of the hand, and resembling the appearance of a snake-bite.

No certain remedy is known for the puncture of this terrible fly; the native doctors smear their oxen with dung mixed with milk; this is supposed to prevent the attack of the fly, which has a strong dislike to the smell of excrement; but this anointing does not always avail. Inoculation has also been tried without effect; but it is said that to administer the fly itself mixed with herbs gives immunity. Baines says the animal thus treated suffers dreadfully, and is brought almost to death's door; but when it recovers, it is believed to be tsetse-proof. The natives also send the young calves into the Fly Country during the day, bringing them back to be suckled at night, and believe that this renders them safe from the fly afterwards. But the best remedy appears to be sponging the animal with ammonia, or perhaps with carbolic acid and water. This has been tried with good effect, as also a decoction of the bark of the roots of the Wittegaat boom (White-bark tree); and some Boers profess to cure animals recently 'stuck,' claiming an ox for each horse thus cured. Baines also speaks of a horse which was cured by 'Croft's Tincture,' the famous South African remedy for snake-bite; and also of two oxen saved by Perry

Davis's 'Pain-killer.' They stood for three or four days with foam running from their mouths, as if the poisonous matter were being thus ejected. After this they began to eat voraciously, and recovered their condition.

A very curious fact in connection with the tsetse is that it affects certain spots, and is wholly absent from others quite adjoining. Livingstone writes: 'We had come through another tsetse district by night, and at once passed our cattle over to the northern bank, which, though only fifty yards distant, was entirely free from the pest. This was the more singular that we often saw natives carrying over raw meat with many tsetse upon it.' Natives can sometimes lead cattle safely through a fly-infected country by knowing exactly the patches to which they are confined, and thus avoiding them; but, as these patches vary according to the distribution of the 'big game,' their knowledge has to be recently acquired, or it cannot be depended upon.

As the tsetse invariably follows the big game, being known as 'the elephant fly,' it is driven always farther and farther into the interior by the advance of civilised man; but as ivory is one of the chief articles sought for by traders, it is evident that in order to obtain it they must also follow the game, and be subject to the attacks of 'the fly,' and this, from time immemorial, has been one of the chief causes of the slave-trade; for the ox and the horse being unattainable as beasts of burden, traders have seized upon the negro, and having purchased him as well as the ivory from the chieftain in possession of both, have compelled the slave to convey the ivory to the coast, where the bearer as well as the burden becomes valuable property. But as ivory becomes scarcer and more valuable year by year, it will, in spite of philanthropists, be more and more sought after; and if the slave-trade is to be effectually put a stop to, some mode of transport must be found which cannot be affected by the tsetse. The best of all is, of course, the 'iron horse,' which is capable of carrying heavy burdens without entailing suffering upon man or beast; but although a good beginning has already been made, and the Beira Railway has rendered approach to the interior practicable from that part of the coast, it must be many years before railways can advance into the heart of Africa, and meanwhile some beast of burden impervious to the tsetse ought to be found. Many have suggested the African elephant or the zebra; but no serious attempt seems to have been made to tame either for the purpose. Donkeys could hardly be taken in sufficient numbers, even if impervious to the fly, which seems doubtful; but the stout mule so frequently seen in Southern Europe might be employed advantageously. The Indian elephant and the buffalo might also be tried. It would, however, be better still could some medicament be found to render the ox and the horse available, for they are always attainable near the various ports, and would be far less costly than native carriers (not slaves), who have now to be hired to convey goods through the Fly Country, and who frequently refuse the task, or forsake the traveller just when most needed, and who, moreover, can only carry about fifty pounds each on a long march, thus rendering a great cavalcade necessary,

and making the cost of transport at least fourteen pounds a ton.

In the meantime the tsetse reigns, and, ludicrous as it sounds, affords protection to the lordly elephant, and opposes its tiny though formidable lancet—more deadly, and less easily avoided than the poisoned arrow of the Pigny and the assegai of the Kaffir—to the advance of the white man, who dreads this insect foe as much as the malarial fevers which so often prostrate him in the swamps and marshes; for, besides rendering transport difficult and costly, it places him at the mercy of the savage negro chieftains of the interior, who, by refusing to provide carriers, can render his journey abortive.

Thus indirectly the tsetse fly may be regarded as the ruler of the Dark Continent, although, happily, his power is waning, for when pioneers have done their work, and received the fiercest of the onslaught, the elephant and other big game retreat to more secure quarters, whither the fly follows, to be again encountered with certain loss by the progressive white man, but to be eventually exterminated, together with the big game with which it is inseparably associated.

LESS THAN KIN.

CHAPTER IV.

THE unexpected shock of Dick Russell's sudden arrival seemed, in some inexplicable way, to put a new complexion upon the rather complicated state of affairs at Denleigh vicarage. As to the cruel and malicious charge made by Joseph Wakelin, that assumed a quite cheerful aspect when this young, strong fellow, with his infectious laugh and happy eyes, had listened to the narrative given by his mother's lips, and then had torn all her fears to shreds, through the remnants of which more sun than shadow was visible.

'You were rather unwise, were you not, ever to let him hear of the loss? Happily, however, one gold piece is uncommonly like another, and I've quite a little sackful up in my port-manteau.'

'But, my dearest son, do you suppose we will rob you?' exclaimed Mildred, her eyes filling. 'If you've been economical enough to save out of your salary, it is yourself who should benefit.'

'So I intend,' he rejoined. 'And to settle old Wakelin's mind is the first of my many advantages. Why, mother, you never thought me selfish enough to be spending all my screw, did you? Only I had a fancy for bringing home a lump, instead of sending dribblets. Of course it is all yours and father's. Don't disappoint me by making a fuss now!'

'At any rate, my boy, we will gladly accept this sum as a loan, until my unfortunate memory reveals what I did with the original amount.'

'Then you don't believe it was stolen?'—in some surprise.

'No; I don't. The more I think about it, the more convinced do I become that I must have put it somewhere for safety. Only the question still remains, where?'

Thus the difficulty was, for the moment, solved. The pupil teachers and the National

Society were paid. And though, owing to Mr Wakelin's fostering care, the story of the loss spread about the parish, and was repeated with surmises and remarks which, had they come to Dick's ears, might have proved detrimental to the peace of the community, the matter was, outwardly at any rate, smoothed over and forgotten.

In regard to the change in Ena's position, however, all was not such plain sailing. For twenty years had these two young folks been taught to regard each other as brother and sister; and if the surprise caused by Sir George's will and the news of Ena's real parentage had come without any preceding interruption to their intercourse, probably the old relationship would scarcely have been disturbed. Such, however, had not been the case.

To Ena, indeed, Dick seemed the same Dick as of yore, only a little older, a trifle more sedate, and a good deal less boisterous and condescending. Also foreign travel appeared to have had upon him the unusual effect of bringing out a tendency to bashfulness unnoticed in earlier youth.

But with the man, matters were far otherwise. When he quitted home, he left behind him a child playfellow, with long flowing hair, and ankles quite plainly to be beheld below her dresses; a child who had been the sharer of his boyish scrapes, the innocent admirer of his wildest escapades, and the sympathising recipient of his university confidence. As a child she had still lingered in his memory during the years of absence; and certainly he would have been less startled to find the same romping, undeveloped girl awaiting his return, than he was at receiving the greeting of a pretty, well-dressed, but quite grown-up young lady. This was not the Ena that he remembered, but altogether a transformed and more impressive personage. And so great was the alteration in herself, that it scarcely occurred to him as extraordinary that her standing towards himself should be different also, and that, in fact, as well as fancy, he had lost his sister Ena for ever.

At first, a sort of shyness fell upon him. When, morning and evening, Ena lifted her face for his kiss of greeting, he blushed; and though he always gave the required caress, he was sensible that perhaps it might have been better to have refrained—a notion which never crossed Ena's brain. But gradually the shyness, though it did not altogether leave him, gathered about itself another and more pleasant sensation. As the days wore on, Dick found that the blank in his life caused by the loss of a sister was becoming more than filled. He discovered that his plans were in some sort governed by Ena's arrangements, and that the thought of her was apt to exercise an influence upon his movements. Last of all, he arrived at the sage conclusion that he must always have had an instinctive realisation that he was not her brother, and that he was extremely glad that the truth regarding her had at length been proclaimed to the world at large. If only they could still keep her to themselves! Yet that was exactly where the hardship lay, that just as she had acquired a new interest and value in his eyes—a value quite unconnected with gold or silver—she must be carried off to make fresh acquaintances, possibly to be inveigled

into a disregard of older and more familiar friends.

'I hate the idea of your going amongst strangers and forgetting all about us,' he exclaimed moodily on the evening before Marmaduke's expected arrival. Mrs Daintry had already written to Mrs Russell, expressing the hope that Ena might travel to Rushton under her son's escort; and Mildred had not seen her way to refuse so natural and proper an invitation. Therefore this was Ena's last night, at least for a while, in the house which from her infancy had been her home.

It was one of those warm, summer-like evenings that sometimes render May such a charming month. The sun was setting behind the houses opposite, and shooting great red rays of glory all athwart the sky. The whole air seemed full of the fading crimson light, which fell upon Dick's dark head, gilding it to bronze; whilst it reflected itself in the brightness of the girl's gray eyes as she stood by the drawing-room window and looked out upon the strip of town garden beyond.

'As though I could ever forget,' she said, soberly and with a quiver in her voice. 'What opinion must you have of me even to say such a thing, Dick?'

He laughed a little. 'It wouldn't be easy to tell you exactly what opinion I have had and still have of you,' he said. 'When I was away, Ena, never a day but the remembrance of you was with me, keeping me, I do believe, very earnestly, from much evil. At that time you used to seem like the child-sister I had left behind.' He paused, finding, apparently, some difficulty in continuing. But she was not looking at him, and therefore did not observe the flush that had crept over his face.

'And now all that will be altered,' she said. 'I'm not your sister! And you'll get to love Bijou more than me; and I shan't come and keep house for you in your curacy; and— Oh, it's perfectly horrid!' With which final outburst of harassed petulance she covered her face with her hands and began to cry, much to the disturbance of her companion.

'Don't, dear, don't!' he implored. 'Ena, you understand just as well as I do that I shall never, never care for that silly Bijou as I do for you.'

The assurance went far to rally her spirits. Truth to tell, Ena was by no means a perfect character, whatever one benighted mortal might consider her. And since she had received the unwelcome tidings of her own rightful place in the world, and consequent loss of all those relationships which had hitherto constituted so great a part of her happiness, there had sprung up in her heart a little, unacknowledged jealousy of Bijou, whose position in the home and household of course remained as of old. Now, therefore, though she did not withdraw her fingers, the voice from behind them sounded almost cheerful as she uttered one word of reply: 'Really?'

'Really and positively. Don't you think,' half timidly, 'that a friend can be quite as nice as a sister, Ena?'

A search which she had been for some seconds diligently conducting in her pocket, here terminated in the distressing discovery that her hand-

kerchief was missing, an idea which entirely drove away all others.

'I wish you'd lend me your handkerchief,' she murmured in the most lugubrious tone. 'I can't imagine what has become of mine.'

That was irresistible to Dick, who was himself as perfectly aware as the lady was absolutely unconscious, that he had been trying his 'prentice hand at love-making. To have his affectionate protestations nipped thus in the bud would have been annoying, had it not been so utterly comic. With a hearty laugh he produced the desired implement. 'Happily, it's a clean one,' he said. 'Ena, you're very little changed, after all! Even governessing hasn't made you prim! Pray, how often used you to have to borrow these articles of your pupils?'

'About once a week,' diligently mopping. 'But they had loads; so, what did it matter? Oh Dick, how hateful of you to have made me cry. It has spoilt all my beauty!'

'Has it?' looking into the flushed countenance and shining eyes.

But the thread of conversation was broken, and he could not take it up where it had been dropped. Besides, Mrs Russell at that moment entered, full of instructions as to the packing. Therefore, when Marmaduke Daintry next day carried off his cousin, pouring showers of information the while upon her devoted and bewildered brain, Ena went in ignorance as to all that Dick had desired to convey, and, indeed, with even a little soreness in her innocent heart that, at parting, when she said good-bye to him, he had not kissed her as usual.

Rushton House was a large and handsome building, of a type very different from the spacious but tasteless dwellings of Mr Wakelin and his brother magnates at Denleigh. The ancient gray walls frowned down upon a garden where old-fashioned flowers were allowed to bloom luxuriantly, and where carpet bedding was mainly conspicuous by its absence. But as the victoria, which had been sent to the station to meet Sir Marmaduke and Ena, bowled quickly along and drew up at the hospitably open door, the breeze came to her laden with the scent of early roses and fragrant lilies of the valley.

'What a grand old place!' she exclaimed, in honest admiration. For a wonder, there had been a momentary pause in the Baronet's stream of talk.

'Awfully jolly, don't you know? A little ramshackle and all that. But money will soon put it to rights. Sir George would never spend anything, but scraped and hoarded in the queerest fashion. Don't intend to go in for that sort of stinginess myself. However,' recollecting that here was a fine opening for a compliment, 'he had so lovely an object for whom to hoard and save, that now I wonder much less than I used at his odd ways.'

'Do you mean me?' with a slight stare of astonishment. 'It's very kind of you to say such nice things. But as Sir George had never even seen me, why'— And she wound up with a quizzical laugh just as the horses came to a stand-still.

In the hall, a tall, rather stately woman was awaiting with some eagerness the new-comer.

Hers had been a sorrowful life, and its troubles had drawn deep lines upon the high forehead and round the once rosy mouth. Married very young to a man for whom she had no love, Cordelia Daintry had been left a widow with two little sons before reaching her twenty-fifth year. Of these boys, her heart had fixed itself upon the younger, and him she watched droop and die in his childhood. The elder lad was at that time at a school, selected by his grandfather—upon whom they were all entirely dependent—solely on account of its cheapness. Here, amongst rough boys, of far inferior rank to his own, the future Baronet was educated, in spite of his mother's remonstrances. Flattered by the masters on account of his prospects, bullied by the boys because of his lack of pocket-money and hampers, Marmaduke grew year by year more unmanageable and less attractive. No persuasions on the part of his daughter-in-law could induce Sir George to incur the expense of a university education for his heir. Nor, indeed, did the youth, who preferred complete idleness, desire it for himself. And Cordelia had the mortification of seeing in her son, upon his entrance into such society as the neighbourhood afforded, a vulgar, underbred representative of a once fine race.

To his marriage she now looked forward as the one hope of saving him from the consequences of past years. If he could but meet with some sweet, gentle girl, whose soft voice and winning ways might have a softening influence upon his coarse manners, and whose money might enrich the estate, impoverished by Sir George's will, Mrs Daintry's ambition would, so far as it yet survived, be satisfied. And as Marmaduke had, upon the first blush of the affair, loudly announced his intention of 'making up to the little impostor' named by his grandfather as so large a legatee, the lady's anxiety to behold Ena may be better imagined than described. It was an anxiety very speedily set at rest, for the worn, rather tired face and the wistful look that crept into her hostess's eyes as she held out her hand in welcome, touched Ena's warm heart. The girl lifted her face and kissed her aunt.

'My dear, I hope you have had a pleasant journey?' It was the customary inquiry, but made in so refined and musical a voice that Ena almost started. Why, oh, why did the son bear no nearer a resemblance to the mother?

'Very, thank you. The'—

'Well, Ena may have enjoyed it. But as to me, I'm downright famished. Thought perhaps they'd have offered one a glass of beer or something at the vicarage; but no such luck.'

Mrs Daintry saw Ena's colour rise.

'I am sorry that you were not in time for luncheon,' the girl exclaimed; 'but I fancied that I heard my mother ask you'—

'Mother! She's no mother of yours! Just look here, Ena; the best thing you can do now is to drop all that rot, don't you know? Old Russell and his wife'—

But even his rattling tongue was silenced there, as his cousin, to whom he was handing a cup of tea, prepared by Mrs Daintry, waved it on one side and stood up. 'Sir Marmaduke, you had better understand something once for all,' she said. 'Mr and Mrs Russell have been more than parents to me during the years when your grand-

father would have left me, as he left my mother, to starve. The next slighting word that you utter against them will compel me to leave your house and to consider yourself from henceforth as a stranger. Thank you,' reseating herself, and accepting the cup he still held. 'Yes, cream; but no sugar, please.'

Not another word passed upon the subject, for Mrs Daintry was too wise to undertake an apology, and her son was actually cowed. But Ena had fought her battle, and her sense of love and gratitude were not again wounded.

Blind as Sir George's grand-daughter had proved to Dick's earliest attempts at winning her, she was quite unable to close her eyes to the persistent efforts of her next suitor. That Sir Marmaduke destined her to occupy the honourable and coveted position of a Baronet's wife had become, within twenty-four hours of her arrival at Rush-ton, as obvious to herself as to the rest of the world. Nor was he one likely to show himself a laggard in wooing or in explaining his wishes, which, within a week, he did in fact accomplish. Certainly, considered as that of a lover, Sir Marmaduke's method might be pronounced unique. The opportunity which he selected to make Ena acquainted with the glory in store for her was one afforded by Mrs Daintry's absence upon a shopping expedition, from which a headache had detained Ena. Later in the day, however, the cool breeze tempted her out, and she started to walk down the avenue to the park gates, where she might probably wait for the returning carriage and drive back with her aunt to the house. But circumstances were too strong for her. She had not accomplished half the distance, when she encountered her cousin, who forthwith announced his intention of accompanying her, and then and there proceeded to expound his views of their future.

'So glad to see that you and the old lady take to each other,' was his first, happily worded, remark. 'She's awfully fond of you, Ena. Thinks you altogether out of the ruck, not in the least one of the common or garden sort!'

'Very good of her!' with an uncontrollable little burst of laughter.

'Oh, not at all, not at all! Any one can see that you were well born, and all that, don't you know? And the mater thinks so much of blood and good breeding, that otherwise things mightn't have been pleasant. Never do for you two, living in one house as you'll have to do, not to agree. She has the right to remain here always.'

'So she ought to have,' indignantly.

'But some girls wouldn't say so. I declare I was struck all of a heap, don't you know? at one time, fancying what battles there might be between her and my wife. But now that's settled comfortably for all parties.'

'Indeed? Allow me to congratulate you. I was not aware of any engagement.' She spoke half in mischief, half with the intention of showing the complete futility of his hopes. Anything would be better than to allow him to indulge in the impracticable dreams which she and her wealth—especially the latter—had induced, though to listen to a formal declaration of his passion was not an occupation which Ena

desired. Sir Marmaduke, however, quickly rose to the bait.

'Oh, come now, Ena,' with a laugh. 'Where's the use of coyness between you and me? The whole county is talking about the way we stand to each other, though I've never actually told you in so many words that I wanted you. There! confess now that you ain't so ignorant as you pretend!'

She flushed all over her face at his boldness. It seemed to her little short of an insult thus to have taken her consent for granted. 'Pardon me. Whatever may be my ignorance, of one thing I am very certain—I shall never be your wife.'

But he only laughed the more loudly. 'Nonsense, my dear. You don't mean to tell me that you're one of the sort that would rob a man of half the fortune that properly belongs to him, and give it to some other chap? Got you there, eh, Ena?'

The sound of advancing wheels told her of speedy interruption and deliverance; yet, ere that happened, she desired to guard against any repetition of such an interview. 'Here's the carriage coming,' she exclaimed, standing still and facing him. 'But before it reaches us, let me be quite plain and frank with you. Believe me, it is best. Nothing that you can say or do, no taunt and no inducement, will ever make me marry you. Please accept this as my final answer.'

For a second or two he stared at her, all the jocularity dying out of his countenance, and a ferocious anger taking its place. At last, very slowly, he turned away. 'Then I'll be seeing after some one else,' he remarked, 'and the sooner you're off these premises the better. I was a fool, or I'd have taken in what all that talk about brother Dick meant! Fancy preferring a parson to a Baronet!'

But by that time Ena was seated in the victoria, offering pretty welcomings to Mrs Dainty, who, upon her side, found it extremely pleasant to be thus petted and made much of by a fair girl who might some day be to her as a daughter. Not the less, however, was Ena's mind fully made up upon the necessity for quitting Rushton House with all decent haste.

With regard to the broad hint concerning Dick, she thrust it out of her memory for the moment, though she did not as yet fully realise to what it had opened her own eyes. She instinctively comprehended that it was one of those matters that must be considered in solitude and quiet. For it had brought her heart and her brain face to face.

That evening, as Mr Russell returned homewards after a long afternoon of visiting in the poorest parts of his parish, he paused to pat on the head a little, curly-haired youngster of about seven years old. The boy looked up at him slyly from under his long eyelashes, the pale, unchildlike features lighting up the while with some feeling at which the vicar did not guess.

'Do you know me, my lad? Are you one of the Sunday-school boys?' he asked kindly.

'Not o' yourn noo. Feyther, 'e 'on't let me goo no more theer. I'm to goo t' Methodists,

coom Soonday. 'E says as thees stole some mooney, and as I shall larn that sort o' thing quick eno' wi'oot trooblin' passon for't.'

Mr Russell's caressing hand fell limply at his side. So, whilst he had been content to fancy the whole trouble at an end, the scandal had been growing day by day, until it had reached a pitch when a child dared fling it in his teeth! No wonder that Mildred started at the sight of the drawn visage that encountered her gaze when, as usual, she went to the door to admit her husband, or that they sat together far into the night over the study fire—the evening had closed in chill and foggy—discussing the terrible little narrative.

'I can see nothing for it but a prosecution for libel against Wakelin,' exclaimed Charles, as at last they wearily rose. 'And I hate to go to law with one of my people.'

'Yet it is for the sake of your people that you must clear your name,' urged Mildred, almost timidly. 'For their sake as much as for our own and our children's.'

'Clear my name! Even the heaviest damages would scarcely do that now. A clergyman's reputation must be above suspicion. To think that my parishioners, after all these years, can believe such evil of me! It breaks my heart.'

YARMOUTH BLOATERS AND RED HERRINGS.

To the herring, for which Yarmouth is so famous, the town owed its first inhabitants. Its site was originally a sandbank in the sea, and was buried beneath the waves until some time in the fifth century, when it began to lift its head above the water. As soon as it had become completely emancipated, the fishermen who resorted to the neighbourhood in pursuit of the shoals of herring, found it was a convenient spot on which to dry their nets. They next erected on it tents, and other temporary shelters for the accommodation of themselves and of the merchants who came to them from London, Norwich, and other populous centres. As the advantages of the site as a fishing station became more and more apparent, the temporary structures gave place to dwellings and sheds of a permanent character.

For the Yarmouth boats nowadays the herring-fishery begins soon after midsummer, and lasts for some eighteen or twenty weeks. At the beginning of the season the boats go into the North Sea and meet the shoals off Scarborough and Grimsby. Very gradually the fish make their way southwards; and the Yarmouth men keep with them until they have passed the little town of Southwold, on the Suffolk coast. In October the fish are off Yarmouth, and are then in their prime. As if anxious to be taken at their best, they come quite close to the beach, so that small shore-boats are able to take part in their capture. These boats are manned by three men, and carry nets which reach a total length of half a mile.

The regular fishing-boats carry nine or ten men and a boy, according to the size of the vessel. If all the space below deck was devoted to the accommodation of the crew, the amount that

could be allotted to each individual would appear to a landsman as most uncomfortably circumscribed. But the hold has to contain the fishing-gear and the fish as well as the men, and consequently the captors are packed about as closely together as their captives. The long hours of arduous toil are unrelieved by anything approaching comfort in bed or at board. There, to quote the forcible words of one of the men, 'it is hog-lying and hog-feeding.'

About one hundred and forty fishing-boats are registered as belonging to Yarmouth; and the neighbouring port of Lowestoft, which, so far as the herring-fishery is concerned, is another Yarmouth, has a like number. Each of these boats, when new and fully furnished with fishing-gear, costs some thirteen hundred pounds. The herring-nets, which, by the way, are generally of Continental make, are twenty-two yards long by eight or nine broad, and cost thirty shillings each. As a boat carries from one hundred and sixty to two hundred nets, it is evident that their total loss—a by no means unfrequent occurrence—is a very serious matter. At Yarmouth, the crew make good any damage to the nets up to a maximum of ten pounds, any loss beyond that falling upon the owner. But at Lowestoft a different custom prevails; there the whole of the loss has to be borne by the men.

A few years ago, the dog-fish, a kind of shark, wrought havoc among the nets, tearing and even eating them in its voracious attack on the herrings fast in the meshes. This pest is now rarely met with. The cod will lay heavy toll on the ensnared herrings, but it does not greatly injure the nets. The loss of nets is now chiefly occasioned by sudden storms, by trawlers, and by excessive catches of fish. If the nets become overlaid with fish, they sink, and are irrecoverable. Barring such untoward accidents, the nets will last for four or five years, and can be gradually replaced. Three or four times during the season they are brought ashore to be retanned, which is done by dipping them into a dark-coloured liquid. When in use they are spliced along one side to a rope, and, being placed end to end, form, from each boat, a snare two miles or more in length. The whole is floated by corks and small barrels. Off Yarmouth the nets are kept near the surface of the water; but in the North Sea they are suspended at a varying depth, determined by the brightness of the moon. Sometimes they are so far down that the lower edge touches the ground.

The nets are 'shot' about three o'clock in the afternoon; at about seven the nearest net is examined. If there are not more than a couple of hundred fish in it, it is let down again, after being emptied, and the work of hauling-in is postponed for two or three hours. Steam is now generally employed to turn the capstan by which the nets are brought on board, thus saving time and relieving the men of a task which cruelly taxed their strength. As it is, they are still severely tried.

As the fish are taken from the nets, they are cast into the hold and salted, layers of fish and layers of salt alternating. A ton of salt is allowed to each 'last' of fish. Last is a numerical term. It nominally means ten thousand; but in practice it signifies thirteen thousand and two hundred, for, according to the peculiar

computation of the fishers, one hundred and thirty-two herrings are counted as one hundred. The ordinary fishing-boats will hold from twenty to twenty-five lasts, and are sometimes filled by one cast of the nets. On such occasions, the men have to work continuously for twenty hours; for, if the hauling-in begins at seven o'clock in the evening, the last net will not be cleared before three or four in the following afternoon; and until that is done, no rest is possible. When the catch is not more than three or four lasts, the boat generally stays at sea for another night.

The fish are taken to the nearest port; but wherever caught or cured, the prestige of Yarmouth is thrown over them; they are all sold as Yarmouth bloaters or red herrings. Even the large, coarse, Norwegian herring is made to share this distinction, much, one would think, to the detriment of the character of the genuine article.

The landing-place for the fish taken to Yarmouth is on the left bank of the Yare, quite away from the sandy beach and the holiday-makers. The wharf is laid with neat granite cubes, and is forty feet wide. For the convenience of the buyers and sellers, there is, adjoining the wharf, a building seven hundred and fifty feet in length and forty feet wide, erected at a cost exceeding twenty thousand pounds. Here may be witnessed, during the herring season, some very exciting and interesting scenes; for, when big catches have been made, as many as two thousand lasts are sometimes landed in twenty-four hours.

The fish are removed from the hold by hand, and a whole day is occupied in clearing a boat that has a full cargo. The combined effect of the pressure to which the lower portion is subjected and of the salt with which the fish are mixed, is to convert the greater portion of the contents of the hold into a solid rock-like mass, which cruelly lacerates the hands of those who, from any cause, do not follow the usual practice of wearing mittens while unloading.

The salted fish are taken from the boats to the premises of the curers, where women at once wash them well in huge tubs. Other women then thread them through the gills on rounded sticks, each holding about twenty-five herrings. By means of these sticks they are suspended in the smoke in which they are dried. The smoke which gives the most delicate flavour is produced by the burning of oak in the form of billets, shavings, and sawdust; but rubbish and chemicals are too frequently employed. The combustion takes place on the bare floor of the curing-house, a lofty building, with its upper portion divided by louvres, arranged parallel to each other at such a distance apart that a man can just straddle across the intervening space, and extending from the roof to about seven feet from the floor. On one pair of the lowest beams stands a man to place on the louvres within his reach the ends of the rods filled with fish as they are handed to him by a woman, or to pass them on to a companion standing above him, over whose head stands a third man to fill the uppermost part. The rods are placed about three inches apart, the space in every direction being just sufficient to prevent the fish from touching each other. Sometimes the workers become almost as smoke-

dried as the fish, for their task is pursued regardless of the condition of the fires.

The herrings are all alike when they go into the curing-house, and are differentiated by the length of time they are in the smoke. Those which are removed after an exposure of an hour or two are of a light colour, and are the 'bloaters' of the fish-shops. They are preferred by Londoners, and are the most profitable to the curers. The longer the fish remain in the smoke the darker they become, and they are finally known as 'red herrings' or 'black herrings,' according to the stage at which the curing ceased. At the other end of the scale are the white herrings. They are the fish just as they are drawn from the sea, and can only be brought in when but a short time will elapse between their capture and their being landed. Well-cured herrings will 'keep' until the following season. The red herrings form the majority of those that are cured. The black herrings are largely exported to Roman Catholic countries.

As the remuneration of the fishermen depends upon the value of the fish they take, it goes without saying that their earnings are uncertain and extremely fluctuating. A catch which fills a boat to its utmost capacity may not be worth so much to the crew as one less than a quarter as great. The quantity of fish that one day would readily fetch twenty pounds, might on another, when the market was glutted, be with difficulty disposed of for a tenth of that sum. The season of 1892 was a good one. Hardly a boat took less than a thousand pounds' worth of fish, while the earnings of many mounted up to thirteen or fourteen hundred pounds. Of the gross sum received, some three or four hundred pounds would be required to meet expenses. The owners of the most successful boats would receive six or seven hundred pounds, and the remainder would be divided among the respective crews.

Not a great sum is it, then, that the hardy herring-fishers earn for themselves by the best part of half a year's toil—toil that, they say, is at times 'harder than any harvest-work'—toil that is ever attended by discomfort and oftentimes by danger. The sea does not allow them to reap their portion of its harvest without exacting such toll as gives fresh occasion for prayers for 'the fatherless and widows.' It is not only the 'caller herrin' that are drawn from the Firth of Forth that may be called the 'lives o' men.'

THE WINNING OF PADDON MANOR.

CHAPTER II.—CONCLUSION.

I FOUND Bickford seated on a bench in the yard where the prisoners walked, with a mug of ale and a pipe, looking by no means down-cast.

'What cheer, Jack?' I said. 'So you've let them catch you at last.'

'Don't ee be veared vor me, Joe,' he answered, puffing at his pipe. 'Buin't no want of money vor liars' (meaning lawyers).

'Ay, Jack,' I said, 'maybe, for this job; but there's worse, and more of it, to come. Concerning fishing, I mean, not smuggling.'

'How do ee mean, vjshin'?' he said.

'Did ever you catch aught but fish?' I said

—'horses, or the like. Alas, Jack, Botany Bay is your port without a doubt, and your wife and children on the parish.'

The pipe dropped out of his mouth and shivered on the stones, while he stared at me, with his eyes as round and his face near as white as a barn owl's.

'All is out, Jack,' I went on. 'My uncle Westcott has confessed it in my presence. Down it is in black and white, with two magistrates witnessing it, and throwing most of the blame on you. Fourteen years' transportation is the least you can expect; and I almost fear that it may come to hanging. But it is sad to see a respectable man of your age, with a large family, about to be taken from them, to wear chains, and eat rotten biscuit, and be flogged once a week for the rest of his life.'

I almost thought that he would, being a stout man, have fallen down in a fit; but when he found his voice, he used it to some purpose.

'The ould roag!' he shouted, with many words which I omit. 'Why, 'twas his plannin', vast an' last, an' I did no more than haul ropes.'

'Good pay for hauling ropes, Jack,' I said. '—But come this way;' for the others came crowding round us. 'There is one chance, and that I am come to give you, entirely out of friendship, for you would not have known till too late. I will write down now, as you shall tell me, how it happened, and how an honest sailor was led into doing such wickedness, thinking it but a joke. Then you shall sign it; and the head-turnkey, or who you will, shall witness your signature; and I will take it post haste to Squire Rendell, who as yet knows nothing; and with a proper use of your family in court, you may see them again in five years.'

Now, all this would not have gone down even with an ignorant man like Bickford, but that the thing came so suddenly upon him. However, I gave him no time to think, but brought him to the room where the lawyers saw their clients, and wrote as fast as I could, whilst a man, cast for sheep-stealing, sat and groaned very dismally.

What it came to was pretty much what I had guessed. The night before the trial of swimming was to be made, my uncle and Bickford, being bribed by Squire Hilliard, had laid down fifty fathoms of a strong ground-seine, made fast, that the upper edge was a yard under water. A gap was left in it of two fathoms, marked by the corks of crab-pots, to guide Squire Hilliard's course. If the net should be discovered, it would pass for one left by accident by Paignton fishermen; but the devil helping them, all went well, and they took care to remove it from the drowned horse, as my uncle had said in his sleep. I asked if the gentlemen in the boat perceived nothing; but he said that, what with drinking of healths the night before and the rocking of the boat, their heads were of little use to them.

So I buttoned up the paper in my breast-pocket, duly signed and attested, and left him, congratulating him on the ease he must now feel in his mind, of which, however, no signs appeared in his countenance. I promised myself much sport, when I should make known to Uncle Westcott how basely he had betrayed his mate and employer. But as I returned on the coach

next morning, who should pass us but the very man himself, in our spring-cart, with a boy driving him. When I got home, Kate told me that he had come over in a mighty fluster, and begged the loan of the cart to take him to Exeter upon most important business.

About noon the next day my uncle came back in the cart, but in a sad plight, having two fine black eyes, and his face bound up in a handkerchief.

'Uncle,' I said very seriously, as I assisted him down, 'it is quite time for you to leave off these rackety doings. You will be up for manslaughter one day, with this fighting.'

He only grunted at this, and I led him into the parlour and set a glass of grog before him.

'Vightin'! he groaned—'much vightin' I done; 'twas Jack Bickford. Her've gone clane mad, vor I cudn' spake a word avore her got me vast by the nose an' most pulled it off my vace, an' banged me about most cruel, carlin' o' me all the old rogues an' betrayin' devils.'

But here I could contain myself no longer, and, falling into a chair, I laughed till the people in the street stopped to listen.

'Be 'ee mad too, Joe?' snuffled my uncle through the handkerchief.

'Never less,' I said. 'But surely you must have been, to go near him. That ever my mother's brother should be the man to do such a thing! What made you inform on him and yourself?'

'Never a word have I spoke consarnin' his doin's!' he said.

'Nor about the nice little trap you laid for Squire Rendell,' I said—'the swimming match, and the seine-net, and the rest?' And here my uncle slipped off his chair, and lay on the floor in a dead faint.

He was carried up-stairs and put to bed; but the shock was almost too much for him, and, falling into a fever, he became light-headed, and put us to no small trouble. For my part, I felt no pity for him; for though I had lost some scruples in the Indies, this was altogether beyond me.

But now it was time for me to call on Squire Rendell with my budget of news. Accordingly, I hired a good horse, and in my best clothes rode up the street like any dragoon, whilst the boys shouted to each other, 'Zee zailor capten a horseback;' and passing the 'World,' old Hawke had the impudence to tell me 'to keep a grip o' the rigging.' So I came out on the Ashburton road, and a pleasant one it was, between hills, red and green, like a Highlandman's plaid, with pasture and corn-fields, and the July sunshine on the dog-rose and traveller's joy in the hedges, and the gray tors of Dartmoor in the north-west; but most of all with the sense of being on a good errand which was likely to bring profit.

When I saw the church tower of Ashburton between the two hills, I inquired of a labouring man for Darleigh, and turning in at a gate he showed me, I was presently in front of the house. It was not so large or fine as Paddon, having been built in Queen Elizabeth's time by the first Squire Rendell; but it was well enough, with a terrace before it, and stone vases thereon, and a

peacock spreading his tail on one, reminding me of India. As I sighted it, a man with two dogs following came out of the hall door and down the road towards me; and as he approached, I knew Squire Rendell, a fine and hearty young man, looking thoroughly generous and liberal, but graver than a man should look at less than thirty, with a good estate and married for love.

'Joseph Smerdon, sir,' I said, dismounting, 'come over from Newton to speak with your honour.'

'Ah!' said he, 'the new landlord of the "Bull." I have heard of your luck in getting to a safe port after shipwreck.'

'It is too soon yet to boast, sir,' I said. 'That is for time to show. But I think your honour has been even luckier than I, for when I last saw you, the doctor of your regiment had almost given you up.'

'What!' he said; 'were you there? I remember a tall sailor, who brought me water.'

'That was I, sir,' I said. 'You remember that I wore a Dutchman's hat, having lost my own in the ditch.'

'So you did,' he replied. 'Well, I am truly glad to see you, and we have both much to be thankful for. Is there anything in which I can serve you?'

'Not as yet, sir,' I answered; 'but it was not to remind you of that I came. I have something to tell your honour that will take your breath away, like the Dutchman's bullet.'

He looked me in the eyes, and I saw that his breath came short. 'Is it about?'—he said, and nodded in the direction of Paddon.

'It is,' I said; and without saying more, we went on to the house. He called a fellow to take charge of my horse, and showed me to a little room, overlooking the flower-garden. Here he shut the door, and waited for me to begin.

'Sir,' I said, 'please to read this;' and I drew out the paper which was signed by Bickford. Before he had read two lines, he gave a great start, and then went on to the end with a strange working of his mouth. Then he rose hastily, and going to a press, poured out a glass of something and drank it, after which he stood for a long time with his back to me, looking out of the window.

'Mr Smerdon,' he said at last, turning round, 'this is heavy news indeed, and I can scarce believe it. I have never thought well of Mr Hilliard; but I would never have dreamed of this.'

'Sir,' I answered, 'when you are come, like me, to middle age, you will not be so easily astonished. I have known rich men do as bad, or worse, to get a thousand pounds.—But will your honour be able to recover the estate?'

'That only a lawyer can tell,' he said. 'At any rate, we must have the evidence of this other man.'

'That we can have, sir,' I said, 'for I am ashamed to say he is my uncle, now lying sick at my house, and it would be well if you saw him without delay.' Then I told him how it had come to my knowledge, and he was pleased to compliment me.

'It was nothing, sir,' I said, 'but luck, which is at the bottom of most things, with a small gift of my own in putting two and two together.'

'I wish,' he said, 'that some of my friends on the bench of magistrates had as much.—But now you must want some refreshment after your ride.'

He withdrew, taking the paper with him; but before he had been gone many minutes, I heard Madam Rendell's voice, which was so clear and penetrating, that she might as well have been in the room.

'What a horrible villain!' she cried. 'George, you must take out a warrant against him immediately, and have him hanged, and all of them.—But he ought to be,' she went on. 'What is the good of the law, if they hang a man for stealing a sheep, and not for stealing an estate?'—Here a door shut, and it was time, for the maid who brought the tray for me, was standing in the doorway, with her eyes and ears, too, wide open.

I made a good meal, and was wishing that I might venture on a pipe, when in came the Squire and his wife, whose cheeks were the colour of the roses outside, and her eyes full of hot indignation.

I rose to make my bow, but she came forward and held out her hand to me. 'Oh, Mr Smerdon!' she exclaimed, 'my husband has told me of you and your dreadful misfortunes, and how you saved him from the Dutchmen; and now you have managed so cleverly, and taken all this trouble to restore him his father's property. I don't know how we can ever show our gratitude'—

'Nelly, my dear Nelly!' broke in the Squire, laughing in spite of himself. 'Do, please, restrain yourself. You have quite put Mr Smerdon out of countenance. I am deeply obliged for all he has done; but we are not at Paddon yet, by a long way.'

'Madam,' I said, 'you have already rewarded me beyond my deserts.—But there is no need for me to stay longer; and if your honour will come over to-morrow, or the day after at latest, we shall make another step forwards.'

This was on a Wednesday; and on Friday, Squire Rendell and a lawyer from Exeter arrived at the 'Bull,' and were shown up into the room where my uncle was. If he had had his wits more about him, he would have been a difficult man to deal with; but shaken as he was, and in danger of his life, in a darkened room, smelling of physis, the lawyer soon had from him very nearly the same confession that Bickford had made. But it seemed that the matter was by no means so easy a one as I had thought, for the lawyer said that, though he could not remember such a case, he feared that the law would not recognise a gambling debt (except in its own lottery); and there was, moreover, a thing called the 'Statute of Limitations,' to prevent the jails being too full. Squire Hilliard was at this time away in London, where it was reported that he used to lead a life very different from his habits at home. Jack Bickford had broken jail, and not been recaptured, which so terrified my uncle, that he was afraid to live again by himself at Teignmouth, and scarcely dared show himself outside our house.

Some two months passed on, during which the lawyers did nothing that I could hear of. One day, towards the middle of September, two men,

Thomas and William Saunders by name, cattle-dealers of Bristol, came to the 'Bull,' substantial men evidently, and riding good horses. They were on the business of buying cattle, to fatten against Christmas, but finding, as they said, prices too high, they left us, and went westward. The day after their departure I had business which called me to Ashburton; and in order to return early, I started almost at daybreak, and rode on so, in the freshness of the morning, that in an hour's time I had reached the town. But as I came to the first houses, I heard behind me the sound of hoofs, and turning, beheld a lady on horseback galloping, and a groom following, who had much ado to keep up. As she came past, I saw that it was Madam Rendell. She knew me, and pulled up as soon as she could, with a plunge and scattering of gravel.

'Madam,' I said, 'is anything the matter? I trust nothing has happened to the Squire?' for I saw that her looks were agitated, and her dress as if she had slept in it.

'I wish I could think so,' she answered; 'but he went yesterday afternoon across the moor to Bovey, and has not returned, though he promised me faithfully to be back by eight. And, what is worse, I have learned that the man Hilliard went the same way.'

'I shall be glad, madam,' I said, 'if you will allow me to see you over the moor; for it is an unkind place, and your groom is not the fellow to be of much service, if you should meet any of the rough folk, tanners or gipsies.'

I remembered, in saying this, that Kate would be in a like pother about me; but I turned from my way, and we went up North Street as the chimneys were beginning to smoke.

We climbed the grievously steep and stony lane towards Widecombe, with the song of birds and rustling of leaves around us in Buckland Woods, and the distant roar of Dart in the valley below; and so past Buckland Church, till the Beacon lay on our left. Here the west side of the moor was before us, gray and rocky, and tumbled like a hurricane sea, yet gay with heather and the furze, which, as they say, goes not out of bloom but when love is out of fashion. Nothing alive was to be seen except some moor ponies far away, and a fox gliding like a red shadow among the stones.

We turned eastward to Rippon Tor, from the top of which good eyes can see Wales on a clear day; and passing round the base of it, we saw a horse feeding, with the saddle turned under his belly. The fool of a groom had no more sense than to sing out, 'Squire's mare, ma'am, Squire's mare vor zarten;' and Madam Rendell turned white to the lips and swayed in her saddle. I went to her assistance, and persuaded her to take a sip of cherry brandy, for which my wife was famous. For I had seen what was far worse, a dead man, in horseman's clothes, lying on his back in the furze, a hundred yards away.

I rode up to him with my heart in my mouth; but how was I amazed to find him that worthy dealer in bullocks, Mr Thomas Saunders, dead of a shot in the breast!

I told this to Madam Rendell; but she would not be satisfied except with her own eyes; and wondering greatly what all this might mean, I proposed that we should ascend Hey Tor, which

would give us a wide lookout. Now, on the top of this hill are two huge great rocks of moorstone, like castles, which can be seen half over Devonshire; and as we approached them, a man came from behind the nearer and ran down the hill to us. Before I could think, Madam was galloping to meet him, reckless of rocks and holes, and flung herself off into his arms, while I judged it good manners to try to make out the Start Point, and the groom fell a-blubbering.

But all the surprises that had gone before were nothing to what awaited us when Squire Rendell bade us follow him to the back of the rock, which is shaped like a judge's head with a wig. Here we found that upright magistrate, Squire Hilliard, not upright any longer, but laid helpless, in a sheltered place among the rocks, and covered with a horseman's cloak. At the sight of him, Madam Rendell turned away, as though she saw a snake; but the Squire bade me ride as fast as I could to a moor farm over two miles away, and bring help; and the groom he sent to catch his horse. It was lucky that I was there, for the men at the farm knew no more than their pigs what to do; and I had to rig up a kind of hammock out of poles and rickcloth with my own hands. There was no surgeon at Bovey, so we went on to Ashburton, four men carrying him, and we riding behind.

And as we went, Squire Rendell told me how this had come to pass. He was detained very late at Bovey, and making haste to return, just as he entered on the moor, his mare, a young and skittish beast, fell, throwing him over her head, and galloped away. He set out to walk; but it fell so pitch dark that he altogether lost his way, and was fain to pass the night, wrapped in his cloak, under the lee of a rock. In the morning he found himself on the wrong side of Hey Tor, and was crossing it, when he heard the sound of pistol-shots, and a horse came galloping up the hill with his rider clinging to his neck, who rolled off at his very feet, being no other than Squire Hilliard. Now the explanation was—as made with much groaning by the wounded man—that these honest butchers of Bristol were a pair of notorious London rogues and land-pirates, who had made that town too hot to hold them. One of these Squire Hilliard had met in the low company which he used in London, and given him mortal offence. So that, overtaking him by chance as he returned from Utcombe, words arose between them, and this rogue pulled out a pistol and shot him through the back. He returned the shot, and, as it proved, killed the fellow; but his horse being frightened, ran away with him; and the other man—having, as he said, when he came to be hanged, no stomach for the work—went off at speed. All this had happened not more than an hour ago, and what the two men had said to each other in that time I know not; but when we came to Ashburton, Squire Rendell desired me to accompany his wife back, while a carriage was procured to take the wounded man to Darleigh; and I saw that as we went, there was a look of triumph on her face.

I waited in much anxiety to hear what the ending of the business would be; but before long, I and all the county knew that Squire Hilliard, before he died, which he did in great pain, had

made a will restoring to Squire Rendell the Paddon estate which he had won from his father, but saying nothing of the baseness he had used to do so.

As for my uncle, I packed him home to Teignmouth, bidding him settle accounts how he liked with Jack Bickford, if they met. But this they never did, nor did any one ever learn what became of that honest seaman, for a body found in the salmon nets at Sheldon had been too long in the water for certainty. My uncle died about a year after, leaving his property to a far-away cousin.

Squire Rendell behaved in a truly liberal way, saying that he felt as much indebted to me as if I had indeed brought Paddon back to him; and my eldest son I named after him. And now that he is dead and all concerned in it, I write these lines, at the age of seventy-two, being unwilling that all knowledge of such a strange affair should perish when I follow Kate to the churchyard.

AT THE EDDYSTONE LIGHTHOUSE.

A LADY VISITING.

LADY.

Oh, dwellers on the deadly reef,
The shunned of every crew,
I've sailed across the summer sea
The breakers dread to view;
I've come to mark your lonely home,
And image to my heart
The scene 'mid which, with calm resolve,
You take so brave a part.

MEN.

Ah, Lady Fair, these sleeping waves
Are giants when they wake,
And from their crests the snowy foam
Like plumes of warriors shake!
But as they leap with frantic force
And thunder-threat of war,
We keep aloft the radiant Light
To be a warning star!

LADY.

Oh, give me each your good right hand;
Oh, give it free, I pray;
I hold each sturdy clasp more worth
Than aught I know to-day.
Oh, let me feel a new-born pride,
Nor chide the fancy down,
That thus my silken life is knit
A moment to your own.

MEN.

Oh, Lady Fair, your kindly words
Our hearts will fondly store,
To cheer us on our lonely rock,
And 'mid the tempest's roar;
While scamen brave shall fearless sail,
And know the reef is far,
For we will guard the radiant Light
That is their warning star!

THE MANCHESTER SHIP CANAL.

MANCHESTER is responsible for a number of bold and successful industrial innovations, and wonderful as the result of some of these has been in the past, the present year (1893) will bring to completion a scheme which certainly surpasses all former efforts of a similar kind in extent, in cost, and in usefulness, and which, from its far-reaching influence, will form an epoch in the history of British trade and manufactures. This new and great undertaking is the Ship Canal which is to convert Manchester into a commodious and well equipped inland seaport, and put it in communication with all parts of the world. The history of the Canal, so far, reveals that during its construction it had more than its share of those difficulties and misfortunes to overcome which usually attend great enterprises when under construction. But these—with the powerful and influential opposition it has had to encounter, and its disheartening financial troubles—will all be forgotten soon, more so now that its completion is an accomplished fact, and they need not be recapitulated or enlarged on here. The questions to be considered now are: (1) What has the Ship Canal Company received in return for its large expenditure? and (2) What are its capabilities and prospects?

The Canal is thirty-five and a half miles in length between its two extremities, and as Manchester stands sixty and a half feet above the sea-level, five sets of locks had to be provided to enable vessels to overcome this difference. It is the widest canal in existence, being nearly twice the width of the Suez Canal, and will allow steamers of the largest size to pass each other. Like the Suez Canal, it has a depth of water of twenty-six feet; while it is three feet deeper than the Amsterdam Canal, and has a capacity fifty per cent. greater. The entrance to the Canal from the Mersey is twelve feet deeper than the lowest dock sill in Liverpool, and will allow vessels of the

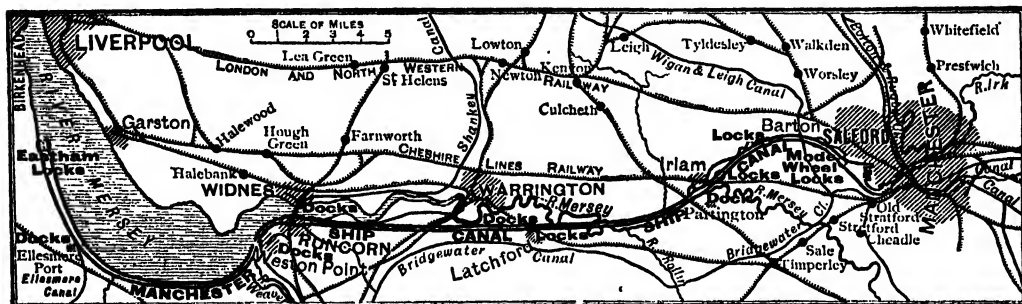

largest tonnage to enter or leave the Canal at any state of the tide. In many of our large seaports this can only be done at full tide; and occasionally ships have to wait some days for spring-tides before there is deep enough water to float them over the dock sill. In consequence, it may frequently occur that of two steamers crossing the bar at the same time, one for Liverpool and the other for Manchester, the latter may be discharging her cargo before the other has got into dock. Steamers can never, except in case of accident, occupy more than half a tide in the passage through the Canal.

While nearly the whole length of the two banks may be considered quay space and the Canal itself as a gigantic dock, there is besides ample provision made to enlarge the quay and dock areas. For a considerable distance back from the Canal there is a broad strip of land on each bank, the value of which in the future it would be indeed difficult to estimate. The large dock area at each port is admirably arranged, and must have cost a considerable amount of forethought in its allotment for the accommodation of the immense quantity and variety of materials to be dealt with. The upper reach of the Canal, which contains the Manchester and Salford docks, is over five miles long, three and a half miles of which is fifty feet wider than the usual breadth, in order to give additional quay space, and more room in the Canal for vessels passing into and out of the docks. These docks cover one hundred and four acres, and the quay accommodation one hundred and fifty-two acres, giving quay and dock areas greater than many of the first-class seaports in the world. There is above the Mode Wheel locks greater dock accommodation than there is in the whole ports of Bristol or of Cardiff. There are smaller docks at Runcorn and at Weston Point; and the construction of a large dock at Warrington is part of the scheme to be carried out later.

The cost of all this has, of course, been enor-

mous, and will amount to nearly fifteen millions of pounds sterling, including the purchase of the Bridgewater Canal and the 4840 acres of land along both banks. (See *Chambers's Journal*, February 9, 1889.) The Canal throughout, in all its details, has been constructed in such a way and of such materials as if it were intended to exist for some generations without repair or alteration, except in the way of being made more convenient or commodious as experience may prove necessary. It has been the fashion to compare it with the Suez Canal. 'Comparisons are odious,' we are told, and this one is especially so. The Suez Canal has only one-half the capacity of the other, and in its construction is a mere ditch, through which steamers are allowed to move at the slowest speed possible, for fear of washing down the sandbanks of which its sides are formed. The speed of steamers along the new waterway

will be from five to six miles an hour; and the passage will be completed—after making allowance of from twenty-five to thirty-five minutes' delay in passing the five series of locks—in about seven hours. The banks of the Canal are carefully protected from injury caused by the wash from passing steamers, the prevention or repairing of which is a frequent cause of expense in canal management. The locks, with their massive gates, are pronounced the strongest and largest in the world. The first is at Eastham, where the Canal begins; and there is tide-water for twenty-one miles to the next locks at Latchford, where there is a rise of sixteen and a half feet; thence to Irlam locks, seven and three-eighths miles—rise sixteen feet; to Barton, two and five-eighths miles, with a rise of fifteen feet; to Mode Wheel, about three miles, with a rise of thirteen feet; and thence to Salford:

MAP OF THE MANCHESTER SHIP CANAL.

making a total of thirty-five and a half miles, and a rise of sixty and a half feet.

All the deviation and main lines of railways and roads, with the Bridgewater Canal crossing the great waterway, are carried over by means of swing or high-level bridges with a clear headway above the Canal of seventy-five feet. The Bridgewater Canal has for itself a swing aqueduct of novel and ingenious construction, weighing fourteen hundred tons. The headway of the fixed bridges over the Canal—seventy-five feet—is considered high enough to clear the masts of cargo steamers, while those of larger tonnage will be able to lower their topmasts.

The Canal has been made in order to carry goods to and from the largest and most populous industrial districts on the globe. Belgium and Holland are considered the most densely populated countries in Europe, and the average in these countries in 1884 was equal to four hundred and sixteen persons per square mile; while the average in the United Kingdom is three hundred and ten to the square mile. Now, looking on a map of Lancashire, and forming a triangle by drawing lines from Stockport to Preston and Leeds, the triangle encloses a greater manufacturing population than any area of similar extent in the world, this area being equal to seven hundred and thirteen square miles, and containing a population of five thousand four hundred and fourteen persons to the square mile, or thirteen times greater than the average square-mile population of Belgium.

While the population of Lancashire has increased about twenty-five per cent. within the last ten

years, it is extremely probable that during the next ten years that increase will be more than doubled. Along the banks of the great waterway there is sure to grow, considering the advantages offered, a large number of industrial works. Even now, the demand for sites is increasing rapidly, and a better situation could not be imagined, with the Canal in front and railway communication behind; and before many years are past, the two banks bid fair to be lined with villages, and new as well as old industries. Still further, as showing the advantages and favourable prospects of the great waterway, it is already in connection with thirteen established canals; and many others are making the necessary arrangements for completing such connection as will cause them to act as feeders to the Ship Canal. If we consider, also, the vast amount of raw material of all kinds which the Canal will carry to Manchester and the great manufacturing districts in touch with it, and that this raw material will be sent back down the Canal again in the shape of manufactured goods for all parts of the world, we may form some faint idea of the tremendous amount of work the Canal will have to perform.

This brings us to consider what are the prospects and earning capabilities of the Canal—a matter which will depend very largely on the economy offered in the trans-shipment of goods from Manchester to Liverpool, and in the immunity from injury through being less often trans-shipped and handled. When the Ship Canal was brought before Parliament, the scales of rates to be charged for the use of the Canal and docks were fixed at a sum graduated for the different articles, which

practically reduces the prices to fifty per cent. of the charges made hitherto. But this is not all. The initial cost of bringing a cargo of cotton, for instance, from New Orleans to Manchester will not be much above the cost (if any) of bringing it from the same place to Liverpool. By Canal the total cost will be 7s. per ton from Liverpool. By contrast, the cost from Liverpool to Manchester at present is 13s. 8d. per ton. The saving by the Canal is thus 6s. 8d. per ton, which, on the eight hundred thousands of tons expected to be carried annually over the Canal, will represent a saving to the importers of £260,000. By taking the average cost of the carriage of thirteen leading articles by the old and new tariffs, we get a saving of 7s. 8d. per ton. Some of the proposed economies are very important. The saving on raw cotton, for instance, will be 6s. 8d. per ton; wool, 8s. 8d.; sugar, 11s. 3d.; grain, 5s. 1d. per ton, and so on.

An estimate of the probable traffic over the Canal, prepared by the 'Consultative Committee,' which made an exhaustive inquiry into the prospects of the undertaking before it was begun, gave for the second year after it is opened nearly 4,250,000 tons, yielding a gross revenue of nearly £800,000 sterling. From this estimate the Committee—considering the scheme an untried one—deducted twenty-five per cent., and this deduction reduced the tonnage to 3,321,320 tons, and the revenue to £595,630 sterling. Appended to the reduced estimate was the following opinion: 'Our estimate of traffic and revenue is much larger, and points to the undertaking becoming increasingly remunerative under capable administration.' The opinion is generally held that in the second year's returns the estimate of the 'Consultative Committee' may be accepted without the deduction of twenty-five per cent. so cautiously proposed by the 'Committee.' They state, further, that 'their estimate of traffic and revenue is not based on any of the statements made in the prospectus, that they have arrived at their conclusions on an independent basis,' and 'are of opinion that during the second year after the Canal and dock are open for traffic, there is a reasonable prospect of securing along the whole length of the canal 4,428,532 tons of cargo, yielding a gross revenue of £794,173 sterling.'

The encouragement and support promised to the Canal Company by the greatest importers and exporters, including merchants and ship-owners, show clearly the attitude that is likely to be assumed by the greater number of those whose interests are thereby to be improved and increased through the facilities and advantages offered; and as the time for opening the Canal to traffic approaches, communications are more and more frequently received from many foreign parts, requesting that the necessary arrangements be made for their accommodation. Some of these applicants are from the most unlikely quarters, proving the introduction of new manufactures and trades. One hundred and eighty-three ship-owners, who represent over one thousand steamers, with a tonnage of nearly one and a half millions—being about one quarter of that of the United Kingdom, without including many other steamers from Liverpool—have signed a promise to use the Canal when convenient.

Turning now to exports. Fifty-six leading

exporters have declared that over one million of tons of textile goods have passed outward each year. Machinery to the value of four millions sterling is exported annually; and many other exports, coal, salt, chemicals, &c., could be added. It is claimed that Liverpool and the Humber ports have fully forty per cent. of the exports and imports of Great Britain. Judging from the applications for sites for industrial purposes—some of them new to this district—also for dock accommodation for lines of steamers, with all the expectations indicated above, Manchester may reasonably expect that a large share of existing traffic will be sent through the Canal, as well as new traffic that is likely to be created through the new and increased facilities presented; for even now there is the prospect of a greater number of steamers entering and leaving the Canal than there is in any other port of the kingdom, if we except London and Liverpool; but even if the Canal does not increase or develop trade and manufactures to the extent anticipated, it must at least arrest a decline in a staple industry which is of immeasurable importance to the Lancashire district, and which for some years past has been in danger of losing the powerful hold it had on the markets of foreign countries, particularly in the Far East.

What will be the result of this creation of a new and large port in the heart of the kingdom? 'It means new industries, new trades of all kinds, and new administrative organisations of many kinds, as well as the extension of old ones. It means the erection of thousands of new buildings for habitation or for business purposes, for education, for recreation, and for all kinds of services public or private.' Years ago, the late Sir W. Fairbairn said: 'Any improvement which will enable ocean-going vessels to discharge their cargoes in a commodious wet dock in Manchester would form an epoch of such magnitude in the history of Manchester as would quadruple her population, and would render her the first as well as the most enterprising city in Europe.'

POMONA.*

CHAPTER XXVI.

And I walked as if apart
From myself, when I could stand,
And I pitied my own heart,
As if I held it in my hand.

MRS BROWNING.

SOME people's troubles are spread over the whole course of their lives, interspersed, thank Heaven! for most of us with intervals of peace and prosperity. Other people, like Job, have them all together, one sorrow crowding on the heels of another so quickly that there is no time for rebound as the blows of fate shower on the devoted head.

So it was with Pomona Lester, who, after a life of almost unclouded sunshine, only obscured a little of late by anxiety for her mother, but brightened by that all too short love-dream, that brief midsummer madness, was suddenly, without a moment's warning, enveloped in this dark cloud of trouble. Everything seemed taken from

* Copyright reserved in the United States of America.

her at a blow. If death had taken Maurice Moore from her, each interview in those sweet summer days, each word, each tone, each look, could have been drawn from the rich storehouse of memory for blessed, healing comfort; now they furnished an armoury of sharp cutting weapons, from which, at any moment, some suggestion, some association of ideas, could draw and plunge into her quivering heart; and her whole proud nature would shrink, and her face crimson with shame at some remembrance of this friend of Mr Ludlow's, this false lover of poor, little Sage's, this man, whose fancy had been caught by Beechfield and the fortune appertaining to its supposed owner.

There was no need for Pomona to try to hide her feelings, to counterfeit the old brightness, and to avoid the scrutinising gaze. There need have been no occasion even to use the word 'mother,' which seemed to choke her at first, but now came constantly unbidden and unresisted to her lips.

Lady Lester slept away the last few hours of her life, only partly conscious of the prayers said by her side, but aware up to the very last if Pomona's hand left its warm hold of hers, or when the girl's voice whispered 'Mother, dearest!'

During the days that followed, Pomona was too prostrate even for thought. She was dimly aware that this could not last for ever; that she could not go on in that darkened room, with Martin waiting on her hand and foot, and nursing her like a child, where her great grief was considered natural and sacred, and no one intruded on it or troubled her with questions, and she might go, as often as she pleased into 'mother's' room and see the waxen face smiling young again among the flowers.

Lady Charteris had come as Lady Lester's oldest friend, that Pomona might not be alone; but she was kind enough and wise enough not to attempt consolation, but to leave the girl to herself, though she strongly deprecated Pomona's fixed determination to go to the funeral; and Pomona almost gave way to her persuasions when she found how weak and shaky she felt as Martin tenderly dressed her in her deep mourning. But she was glad she persisted. The beautiful August sunshine lay on the broad stretches of the park as the solemn procession passed along the beech avenue, where autumn was beginning to make its coming known in a touch of yellow and red on the shining leaves; and the deer raised their dainty heads to listen to the bell tolling deep and slow from the little church. Generations of Lesters had been laid to rest in that little Norman church, just inside the park, which was crowded now from far and near with gentle and simple for Lady Lester's funeral, and Pomona met many a kind, sympathetic look both from rich and poor. There was one face among the throng that caught her notice both in the church and at the grave-side, an honest, kind, middle-aged face, looking at her with straightforward, fatherly eyes, that more than once met hers with a quick glance of sympathy, as the comforting words of the grand and beautiful service sounded tenderly in her sad heart.

She forgot all about that face and the shabby coat attached to it till later in the day, when most

of the funeral guests had left, and she went down to the library, where Mr Freestone was sitting, as she thought alone, looking over the family papers. But when she entered the room, this same stranger was sitting there with the lawyer, and at her entrance got up and prepared to leave the room.

'Dr Merridew,' Mr Freestone said; and Pomona held out her hand.

'You are Sage's father and'—She was going to add, 'my uncle,' but she stopped. 'Don't go,' she said. 'What I want to say to Mr Freestone concerns Sage so much, that I should like you to hear.'

Now Dr Merridew had set himself steadily against Pomona; and all that Sage had told him about her had only added to his prejudice against her; but the first look at her in church had converted him; and when he took her little hand, he was her faithful champion for life. So he drew up a chair for her, and resumed his own seat opposite Mr Freestone at the table.

'I wrote a letter to you some days ago,' Pomona said.

'You did,' answered the old lawyer; 'and I should have replied to it but for the sad event that has intervened.'

He stopped, and she looked expectantly at him, but he said no more.

'Did you know—had you the least suspicion that I was not Sir John and Lady Lester's daughter, but only an adopted daughter?'

Mr Freestone's wrinkled old face was inscrutable; but Dr Merridew turned with interest as she spoke.

'Did you know?' she repeated.

And the lawyer bent forward and laid his withered old hand on hers: 'My dear young lady, I have known it these twenty years.'

'But surely, surely, I have no right to any of the property? It is Sage Merridew who ought to have it.'

'So she would, my dear; and perhaps it was a little hard on her that she didn't; only, you see, Sir John, after the death of the two boys, left it, as he was perfectly able to do, absolutely to you, subject, of course, to the life-interest of Lady Lester.'

'But I never knew I was not her own child.'

'No; it was Lady Lester's wish that you should not; and she took every precaution to prevent it. I always think unnecessary secrets are a mistake, as they generally leak out somehow, and sometimes do a lot of harm. But you would have been obliged to hear it now, in the ordinary course of affairs. May I ask how you heard of it?'

But Pomona had turned to Dr Merridew, thereby avoiding a question she did not care to answer. 'Dr Merridew, I am sorry.'

'Don't be sorry, my dear. I am heartily glad. Fancy my poor little Sage with a big fortune and large estates! It would have crushed us both, with the weight of responsibility. Besides, Lady Lester has left my little girl what is really a large fortune.—Three hundred pounds a year, isn't it, Mr Freestone? It means a lot of solid happiness. You can't buy ready-made happiness with money; but you can buy a good deal that makes up happiness if you know how to manage it.—And I am very grateful to your mother,

Miss Pomona; though, not so long ago, I prided myself that I would rather starve than accept a penny from one of my wife's family. But I'm not so young or so foolish or so proud or so strong or so whatever you like to call it, as I was; and I have a poor, little, sick Kitty, who will want a lot of care this winter; and perhaps that money of Sage's may mean the south of France and life to my little girl. So, my dear, keep Beechfield, and welcome.'

'But'—Pomona hesitated—'I was told she was engaged, and that want of means prevented her marriage.'

'Ah, that is all at an end; and as Sage is not here to look reproachful, I may say, and a good thing too! And at the risk of Mr Freestone thinking me an unpractical and sentimental old goose, I wish to record my opinion that any marriage prevented by want of means is a fortunate escape for both parties concerned.'

'And if a man marries a girl for her money?'

'I don't regard it as a marriage at all; not holy matrimony anyhow. It is merely a civil contract, and a poor concern even at that.'

The old lawyer was deep burrowing in a tin deed-box; and Dr Merriew and Pomona stood in the window, against which a sudden storm of rain was beating; though, beyond, the sun was still shining on the great trees in the park, like smiles through tearful eyes; and Dr Merriew talked softly to the girl of 'her mother,' always using the dear familiar name, and of the tender mother's love that had surrounded her happy young life, and was still a living, present thing, though out of sight.

'Is Sage very unhappy?' she asked presently.

'Yes, very, just now. We all have to go through it sooner or later; but she believes in her hero implicitly still, and though I can't say I agree with her, if it is any consolation to her, let her, say I.'

'Yes,' said Pomona softly, 'let her.'

And as they stood and talked, a great rainbow spanned the heaven in front of them, one end resting on the great beech-trees, and the other on the shining grass, where the deer stood, not knowing of the fairy gold that might have been found beneath their feet. And on the ivy outside the window, each leaf held a drop of rain, and every drop had a glistening little rainbow of its own, as every life has its sorrow; every sorrow, in God's sunshine, hope.

'You are a doctor,' Pomona said, when they parted. 'Don't you think the south of France would do me good this winter too?'

'Just what I was thinking. I will write a prescription.'

'And I am so used to nursing, I can help Sage to take care of Kitty.'

'To be sure you can.'

CHAPTER XXVII.

Comfort? Comfort scorn'd of devils; this is truth, the poet says,
That a sorrow's crown of sorrow is rememb'ring happier days.
TENNYSON.

Five years have gone by since then, and Owen Ludlow is still living at Scar, a very lonely old man, wandering about the beach and cliffs in an aimless, restless way, growing yearly more odd and morose and unsociable. Mrs Stock looks

after him as she used to after her husband, in a pitying, patronising way, as she would after a troublesome child; but as she expressed it, she 'was terrible put about' when she first heard him spoken of as the mad painter.

'Lot' bless you! he ain't any more mad than half the men is, as is a poor, helpless lot. There ain't no harm in him. He used to be a terrible fine painter, and thought a lot of np in London, folks say; and one of them pictures was in the Royal Academy, and folks did say as how he got a wonderful big price for it; but that ain't true neither, for he've agot it now, and it's hung up in his studio, right over against the door, with a curtain drawn across it. But it got hurted coming down in the train; them porters is that careless; so he've painted out the face in the middle, which he set great store by, as I've heard tell was took from his wife as died when her first baby was born; and he've never painted it in again. He don't do no painting to speak of now, though he gets out his brushes nows and thens, and sets his palette. 'Tis bad when a man's getting on in life and ain't got neither chick nor child to look after him.—He ain't heard nothing of Miss Sage this ever so long. She's been a deal in furrin parts along with poor, little Miss Kitty, as enjoys terrible bad health, poor lamb! And Mr Moore—as we fancied was making up to Miss Sage, and a nice couple they'd amade too—he've gone to New Zealand or somewheres; and Mr Ludlow don't seem to care to hear his name as much as mentioned; so I reckon they've fell out.'

But one day in May a lady came to the farm asking for Mr Ludlow—a tall, handsome-looking lady, whose face Mrs Stock could not put a name to, though it seemed in a curiour way familiar to her.

'Mr Ludlow, mum? He's down to the beach, I reckon. He mostly goes down fine mornings. But if you steps down the street and along the beach-path, and looks a bit along towards the Point, you're bound to see him, for he don't go far.'

The apple blossom was out in the farm orchard, and the tree by the studio window was covered with dainty flowers, and Mrs Stock broke a little bit off to give to the young lady, who admired it so.

A little way along the beach, on the flat stone where Kitty used to watch the doings of the sea-creatures in the pool, and Sage had read Maurice's letter, sat Owen Ludlow, a very solitary-looking figure against the brown seaweed-covered rocks and gray-green sea. He was not painting or pretending to do so, but leaning forward with his elbows on his knees, and his chin on his hands, gazing away towards the Point, against which the foam flew up, and round which the white gulls circled.

He did not hear her step as she came over the rocks towards him. He had taken off his hat, which lay on the rock beside him; and she noticed how white he had grown since she saw him last, and how the wind from the sea stirred his hair, giving a sad suggestion of King Lear in his desolate old age. He was so still, that a momentary chill swept over her that he might be dead; but the next minute he had moved, passing his hand across his eyes with a sort of

patient weariness that was very pathetic. And then he turned, and saw her standing with the apple-blossom in her hand, and the look of tenderness and pity on her face; and he rose with a look of sudden, glad recognition and delight.

'Katharine,' he said, 'I knew you would forgive me at last.'

And then he would have fallen, had not Pomona caught him and drawn the gray head to rest on her shoulder, saying, 'Father!'

THE END.

MARIE ANTOINETTE

IN the late autumn of 1793 there sat one evening by a cheerful fire, in a snug parlour in Dumfriesshire, a little knot of friends, the mother of the household, some of the children, a married daughter and her husband, the minister, who was a near neighbour, and the farmer of Cleughhead. The early tea was over, and they were having a game at whist, listening at intervals to the dashes of rain on the window-panes and the roar of the Nith as it rushed in full torrent to the sea. 'The guidman's late,' said the mistress, a little anxiously; but as she spoke, a horse's hoofs were heard on the gravel, and in another minute the rider, with topcoat hastily thrown off, but still booted and spurred, entered the room. Something strange in his aspect struck them; but before they could speak, he said in an awestricken tone: 'The Queen is dead.'

'Dead!' was the horrified rejoinder.

'Ay, dead—murdered on the 16th of October; carried to the place of execution on a common cart, with her hands tied.'

No need to ask who the 'Queen' was. Marie Antoinette's fate had been canvassed everywhere for weeks past; but it was the universal belief that, bad as the revolutionary party might be, they would never dare to kill her: she would be saved somehow. But the end had come, and what an end for Maria Theresa's daughter!

A little girl of ten who sat quietly by the fire, and who lived to be over a hundred years old, often told in her later years of the vivid impression made upon her young mind that evening. Never could she forget the dismay and horror which filled the little party, and the sudden gloom which came upon them. Every one thought the king's death terrible, she used to say; but when it came to murdering the fair, gracious Queen—that, indeed, could not be forgiven or passed over, and for months nothing else was talked of.

Though a hundred eventful years have passed, Marie Antoinette's fate has still a pathetic charm; and now, on the anniversary of her death, we look back on her with tender interest, as the little group assembled in the Dumfriesshire parlour might have done, as daughter, wife, and mother, leaving parties and state questions aside, trying to get a glimpse of the real woman—'la belle *peuvre* reine,' as a French working-man in blue blouse and flat cap called her, in speaking of her one lovely spring evening on the Versailles car.

Little 'Antoinette,' as she was called, was the

favourite child of Maria Theresa and Emperor Francis I. She was born at Vienna on November 2, 1755, the day of the great earthquake at Lisbon; but her early years were passed chiefly at Schönbrunn, in simple country pleasures, the child's garden there being the precursor of the gardens at Trianon. A considerable part of her time, as she grew a little older, was devoted to study, Metastasio teaching her Italian, and Gluck giving her lessons on the harpsichord. As, from her early days, Maria Theresa destined her to be the bride of the Dauphin, she got a French tutor for her, the Abbé de Vermond, and French actors to teach her elocution.

One evening in April 1770, the French ambassador preferred a formal request for the hand of the Archduchess, all having been arranged before; and after ten days spent in festivities, the bride of fifteen left all who had been dear to her. When she left Vienna, the poor people on the streets crowded round her carriage weeping, as they bade her farewell, and following the cortège to the very gates of the city. In a pavilion on an island in the Rhine near Strasburg, she had to divest herself of all her German clothing and array herself in French clothes brought from Paris. As she passed into the salon where the French party awaited her, an eye-witness says: 'It was impossible to refrain from admiring her airy walk; one smile alone won the heart.' Wonderful festivities welcomed her to Strasburg and other cities. She charmed the students at Soissons by replying to a Latin oration in a sentence or two of the same language.

The Court came out to meet the bride as she drew near Compiègne. Quickly she alighted from her coach and sank on her knee in homage to the king, Louis XV., who raised her at once with a graceful compliment to her mother: 'Vous étiez déjà de la famille, car votre mère a l'âme de Louis le Grand.' Among the family group who awaited her at La Muette was the Princess Elizabeth, the Dauphin's youngest sister, and Princess Lamballe, both of whom were to be so closely associated with her in after-years. The Dauphin came with his grandfather to meet her; but beyond that, we hear very little of him!

The young couple were married in the Chapel at Versailles next day, May 16th, at one o'clock. A canopy of cloth of silver was held over their heads by two bishops, and the ceremony was performed by the Primate of France.

Imagination pictures the beautiful young creature, gay and bright, winning all hearts, and yet by the dignity of her bearing reminding all that she was the daughter of the Empress Queen. When she made her entry into Paris, and dined in state at the Tuileries, the shouts of the people were so vehement that she had to show herself on the balcony facing the garden. 'Grand Dieu! what a concourse!' she said, looking at the sea of faces.

'Madame,' said the old Duc de Brissac, Governor of Paris, 'I may tell you without fear of offending the Dauphin that they are all lovers!'

Did she think of that gallant speech when

once again she looked on a sea of angry faces from the same spot?

The years of her early married life passed on in a gay round of outward pleasure, theatre-going, weekly balls, card-parties, and sledging, which she introduced at Versailles; but with it all she had inward trials and disappointments, cabals in the Court, and jealousies in the family circle.

On the 10th of May 1774, Louis XV. lay dying of smallpox at Versailles. The young couple were awaiting the end in their own apartments. In the words of Carlyle: 'Hark! what sound is that?—sound "terrible and absolutely like thunder." It is the rush, of the whole Court, rushing, as in eager salute the new sovereigns: Hail to your Majesties! The Dauphin and Dauphiness are King and Queen! Overpowered with many emotions, they fall on their knees together, and with streaming tears, exclaim: "O God! guide us, protect us; we are too young to reign."

The carriages drove up, and the whole Court set off for Choisy, at four in the afternoon. Four days later, the young Queen wrote a letter to her mother, full of joyous confidence in the bright future before her. But the Empress, knowing the burden of a crown, feared that her child's happiest days were over. Soon after she became Queen, the King presented her with the Little Trianon, a villa about a mile from the château of Versailles, within the Park. The house remains to this day, a cheerful, unpretentious abode, with lawns, gardens, and winding walks, which were the delight of the poor Queen. On the outskirts of the garden she constructed the *hameau*, which was her special delight—the rustic farmhouse by the little lake; the miller's house; the dairy, where she loved to make butter; the flower-beds, where she worked. She forgot, as she said, when dressed in her muslin gown and straw hat, that she was a Queen; and made coffee for the King, as if they were country folks. Even here, and in these innocent pursuits, detraction followed her! She was called 'the Austrian' in contempt.

In the year 1778 a little daughter was born to her—the Madame Royale of history. In October 1781 a Prince was at last born, and the whole nation rejoiced with the glad father and mother. All the 'trades' of Paris came out to Versailles in procession; while the 'Dames de la Halle' paid a state visit to the Queen.

Little did all these gay congratulating folks, and least of all the happy King and Queen, think of a very different procession which was to come and tear them away from Versailles for ever.

The Dauphin at this time began to show signs of delicacy, so it was with great thankfulness that the King and Queen hailed the birth of another son in 1785. The proud father took him in his arms, calling him the 'little Norman,' and created him Duc de Normandie, saying, the name alone would bring him happiness—dreaming not that few if any kings' sons would have such a miserable fate.

It was about this time that the affair of the Diamond Necklace took place; and though it was proved that the handwriting and even

the appearance of the Queen had been counterfeited, still some remained who were only too willing to believe evil of the Queen; and at the head of this party was the wicked Duc d'Orleans, afterwards known as 'Egalité.'

The Dauphin steadily declined in health; but the Duc de Normandie grew and flourished; and it is amusing to read the account his mother gives of him in a letter to her brother the Emperor: 'He has all his elder brother wants; he is a true peasant's child, tall, stout, and ruddy.' The Princess Elizabeth became from this time the Queen's closest, dearest friend—her sister in heart as well as in name, never to be separated but by death.

In the long procession of events which began with the summons of the States-general to Versailles in 1789, and ended with the Conciergerie and the guillotine in 1793, only a few traits of the Queen as wife and mother can be noted here. On the 4th of May the States-general met; and on the 4th of June, in the midst of stormy scenes, the little Dauphin died. In July came the storming of the Bastille; and on the 17th of July, Louis XVI. drove into Paris with a very slender escort, determined to pacify the people. We are told that Marie Antoinette sat with her children shut up in her own room. She shed no tear, but a sob broke from her now and again with the words, 'They will never let him return.'

He returned only to fresh trials and indignities. In September they were warned that the mob would attack Versailles; but so little did they think it possible, that when the Duc de Chinon—who, disguised as an artisan, left Paris with the mob, but got to Versailles some time before them—reached the palace he found the King was hunting in the Bois de Meudon; while the Queen was working in her garden at Trianon. Messengers were sent in hot haste; and we can picture the Queen hurrying away from her garden, little thinking she would never return.

When the savage mob shouted for her more like wild beasts than human beings, she took her children one in each hand and stepped quietly out on the balcony. 'No children!' was the savage yell which greeted them. Leading them back into the room, she returned alone, and stood with arms crossed and eyes looking heavenward, expecting instant death; but her very fearlessness disarmed the mob. When they were driving into Paris, they were surrounded by this mob, who brandished pikes with the heads of the slain body-guard, and shouted they would have plenty of bread, as they were bringing the baker, the bakeress, and the baker's son with them. Her mother's heart was wrung by the sufferings of the child, who could get nothing to eat all day long.

In their varying fortunes at the Tuileries, how many glimpses of her we get! watching the Dauphin playing in the gardens, feeding ducks in the pond, teaching Madame Royale, walking with the King, or riding with the Princess Elizabeth—though always guarded—in the Bois de Boulogne. For years past her character had been strengthening; she set the example of her mother ever before her, and there was much truth in the saying of Mirabeau, 'The only man about the King is his wife.'

How great her presence of mind was, was shown in many details of their journey to Varennes. Count Fersen drove them through the streets of Paris to the Porte St Martin, where they were transferred to a *berline* which was waiting for them. Every one knows the sad story of a hundred miles without any sign of pursuit; then the uniforms of Bouillé's soldiers appearing at Chalons, and the Queen's fervent exclamation, 'Thank God, we are saved.' Drouet's recognition of the King from a stamp at St Menesbould, and the stoppage of the party at Varennes about eleven at night, when Bouillé's troops were actually waiting at the other end of the town. If the King had not put his head out of the window, which he would do in spite of all warnings—if young Bouillé, who was in command, had sat up all night—if the troops had been at the nearer instead of the farther end of the town, who can say how matters might have turned?

For this once only did the Queen's courage and spirits fail. She wept incessantly, beseeching the grocer's wife in whose house they spent the night to have pity on her children; and when she saw there was no hope, she sat gazing on the two sleeping children with the calmness of despair.

They were carried back to Paris, where they found themselves really prisoners at the Tuileries, sentinels being placed in the galleries and gardens, and even at the door of the Queen's bedroom. No wonder she writes at this time: 'It takes more courage to support my condition than to fight a pitched battle.' Insults and menaces; and when they went to the opera and the royalists shouted, 'Vive le roi! vive la reine!' the greater part of the house rose, shouting, 'No master, no queen.' Yet at other times the fickle people cheered them to the echo. 'It is a queer nation this of ours,' wrote Princess Elizabeth; 'but it has its charming moments.'

As months passed, the Queen, though brave outwardly, often found relief in tears when alone with her children. One day the Dauphin was reading a book in which he came upon the expression 'happy as a queen.' 'That is odd,' he said; 'for my mother is a Queen, and yet she often weeps.'

Tippoo Sahib at this time sent an embassy to the King with gifts of Indian stuffs and jewels, which the Queen gave away all except some pieces of white muslin, of which we shall hear again.

Then came the 20th of June, when a mob surrounded the Tuileries, calling for the heads of 'Veto and his wife,' which was a new name they had given their victims. This storm blew over. But on the 20th of August, after hours of terror and scenes of horror, Louis was persuaded to leave the Tuileries and throw himself on the protection of the Assembly; and the hapless family left the palace, which only Madame Royale would ever enter again. Marie Antoinette, it is said, paused a moment at the foot of the great staircase. 'Fear nothing, Madame,' said a kind-hearted Swiss. 'I do fear nothing,' was her reply as she passed on.

Across the gulf of a century, we see them still, a mournful little party, crossing the terrace on foot, the little Dauphin, child-like, kicking the

dead leaves as he went, and the King remarking, 'How early the leaves fall this year!'

From the Assembly they pass to the Tour du Temple; and we see them no more till they come out one by one to die. From Madame Royale's Journal, we find that she and her aunt shared one dark small room; and in another not much larger, a little bed was placed for the Dauphin beside his mother's. The King's rooms were on a storey above. Insulting phrases were written on the very walls of their rooms; while on the King's were painted weapons and instruments of torture. Without proper clothing and food, and almost without attendants—watched by guards and spies—ignorant of all that was passing beyond the walls of their prison—still they had a mournful happiness in being together. One day after dinner, the King and Queen were going to play backgammon, at which they could sometimes exchange a word without being heard by their guards, when cries were heard outside; one of the guards closed the window, another insisted the Queen should come and look out. It was the head of Madame Lamballe which the ruffians had cut off, and forced a poor hairdresser to dress as if in life. The sight seemed to turn the Queen to stone.

Soon came Louis's sentence of death and their last interview. Through the glass doors the guard watched them: there sat the King, the Dauphin standing beside him, Madame Royale kneeling at his knee, the Queen leaning on his shoulder, Madame Elizabeth behind in silent anguish. He tears himself away, but says he will see them next morning. All night the Queen lies shuddering, and when morning comes, the roll of the drums tells her that he is gone.

A little longer, and then her son was taken from her. One night he lay asleep; a shawl was hung before his eyes, to shield them from the light by which the Queen was mending her clothes; a band of Commissioners burst in and snatched him from her. Happily, she never knew the fate of the beautiful boy she loved so tenderly. A month after, in the dead of night, she herself was carried off to the Conciergerie, where the cell she occupied is still shown. As she passed through the doorway she struck her head. One of the men asked if she had hurt herself. Her answer was: 'Nothing can hurt me now.'

Those who wished to see her could pass through her cell, where she sat as in a stupor, on an old chair, in a dress which had once been white.

On the 13th of October came the trial of the 'Widow Capet.' Clad in white muslin, with a muslin fichu, part of Tippoo Sahib's present, her gray hair drawn simply back and knotted loosely behind her head—never had she looked more queenly. The trial lasted night and day till the early morning of the 16th of October, when sentence of death was pronounced. She was led from the court to the condemned cell at five in the morning, and her only request was for writing materials. She then wrote the touching letter to Madame Elizabeth which may still be seen in the Archives Nationales in Paris. When this last duty was done, she threw herself on the pallet-bed and slept till the executioner called her

at seven. She was taken on a common cart, with hands bound, seated on a plank beside the executioner, to the Place de la Révolution. She heeded not the jeers and execrations which followed her on her long slow progress through streets filled with people whose idol she had been. One sad glance she cast at the Tuileries, and then mounted the scaffold. As she did so, she trod on the executioner's foot. 'Pardon me, sir,' she said, and then, 'Make haste;' and in a moment all was over.

LESS THAN KIN.

CHAPTER V.—CONCLUSION.

A FORTNIGHT later, Joseph Wakelin was standing at the vicarage door, as he had stood every morning for a week past. His hand was upon the bell, which he pulled with evident care. The man's face seemed to have altered of late, losing something of its coarse self-assurance; and there was an obvious expression of anxiety in the eyes which he raised to Ena's face as she appeared in response to the summons. It was Jane's work, but Jane was otherwise occupied; for sickness is apt to disorganise a household, and sickness—the result of his last day's visiting—was upon the vicar now.

'How is he?' asked the manufacturer softly.

'As bad as he can be;' fresh tears rising to her eyes, which already showed traces of weeping. 'Jane is out, Mr Wakelin; so I came to tell you that, if you are not nervous about the infection, father would be very glad to speak to you for a moment.'

The strong man's face blanched, but not with fear. 'Infection? Me nervous? Not quite,' he said brusquely as he entered. 'What can I do for him?'

'This way, please. No; the doctor says there's really no danger to other people now. His throat is all right, but the diphtheria has left him so awfully weak.' Then, almost in a whisper: 'Try to be tender to him, Mr Wakelin.'

Perhaps he heard, perhaps he did not. At any rate he made no reply; but, after tapping gently at the door she indicated, went gently in and closed it behind him.

The sight of the pale, wasted features upon the pillow thrilled him to the heart; for he had a heart, though one hard to be reached, encased as it was within a very thick and rough exterior shell; and none understood better than he how greatly his own actions had contributed to bring the clergyman thus low.

'If his spirits were not so depressed, he might yet rouse himself and pull through; but with all this load upon his mind, whether he deserves to have it there or not, I doubt if he'll rally,' the doctor had remarked to Wakelin only yesterday.

'He doesn't deserve it,' that worthy managed to bring out gruffly, as he turned off, carrying a shaft in his soul that rankled sorely there, and leaving Dr Mitchell to nod sagaciously as he muttered to himself: 'Then, my friend, you merit more than ever you'll get in the way of punishment.'

From the side of the bed, Mildred, wan with

long nursing and watching, advanced, with the ghost of a smile, to offer her hand. And, hearing a footstep, Mr Russell opened his eyes. 'It is you!' he murmured in a weak whisper.—'My dearest, leave us for five minutes.' And the wife obeyed.

'I can't talk much,' the vicar said, still in that same husky tone; 'yet there's one thing I want to tell you, Wakelin. I am a dying man'—

'Don't lose heart, sir. Indeed, Mr Russell'— But the other did not heed the interruption.

'The word of dying men is generally credited. So I desire to assure you—once more—that I never appropriated—that money,' the last words coming out in a series of gasps painful to hear.

'Oh sir, I'm sure on't,' cried the manufacturer. 'I've been certain this long while! But the chance to pay back old scores wor too good.'

A brighter gleam came into the dull eyes. 'You did not actually doubt me?'

'Only nows and thens at first. Niver sence that day in the study. No guilty chap could 'a spoke as you did then.'

'And yet you spread the story?'

'Yes, I spread the story,' in dogged confession.

'Why?' as the languid eyes closed again, and the head turned restlessly upon the pillow.

'To bring you down,' blurted out the Yorkshireman. 'I'm as good as you any day, and you'd never own to it. And so'—

Mr Russell started feebly and again looked up. 'Never own to it? Have I seemed as proud as that? Then—I deserve—it all!' more faintly than ever.

'Oh sir, never give in! I'll save your death on my conscience, if anything happens. And I'll do all as in me lyes! I'll tell the parish that I've been a fool! I'll'—

The vicar smiled, such a pathetic, dreary smile. 'A tale is more easily put about than contradicted,' he answered. 'Do what you can. But remember—if your friends—still think—the worst—it is—your—punishment! We've both—been wrong. Forgive me, Wakelin!' his thin fingers wandering in search of the other's hand.

The man sank on his knees upon the floor, and burying his face in the bedclothes, burst into tears. 'If on'y you'd a spoke so afore!' he wailed, 'if on'y you'd a spoke so afore!'

It was thus that at length they came to a better appreciation of each other. And though when, in another minute, Mildred summarily ended the interview, she found her husband too weary to move or speak, his talk with Wakelin proved the turning-point in his illness. From that hour, very slowly yet surely too, strength began to return to him, and the cloud hanging over the household seemed to lift. The desire for life had come back, and with it the power to recover.

'I dared not die with that charge of pride upon me,' he said once to his wife, as they talked the incident over together weeks later. 'For it was true, and I have been guilty. Mildred, I must make what reparation I can.'

'It seems to me that your fault was a very small one compared with his,' remarked the lady, 'even supposing yours was a fault at all. But really, Charles, not to show that you consider

yourself better born and better bred than these people'—

He laid his hand on hers with a silencing glance of reproof. 'Mildred, you have been nearly as bad as I. Let us try to help each other to amend,' was his only answer.

'And what of the injury that Wakelin has done you, and done purposely, too?' she retorted. 'I suppose you'll not prosecute now?'

'No. Many things become plain to one in illness. I have been proud and offensive to my people, or they would never have treated me as they have done. It is just chastisement that I should be lowered in their eyes. And I must bear it.'

Of course she loved and honoured him the more for the resolve; yet, knowing as she did more than was possible for him, still shut up in his sick-room, to know of the utter futility of Wakelin's repentant efforts to stop the ball which he had himself set rolling, her woman's heart sank as she listened to that decision.

'Eh mon, they've got ower thee! On coorse t'passon took fever from Tom Atkin, poor lad. But that don't giv' un noo roight t'tak' mooney what belongs t' parish,' was the sort of response with which Joseph's best arguments were met. 'Tell us wheer t'coin went if not t'Clarke, and then'— Till at last Wakelin was almost in despair.

'Mr Russell, sir, wain't the Bishop move you? This air ain't the kind for delicate folks; and it'll be some while afore you're as strong as you wor,' he remarked one morning to the vicar, with all good intentions, but singularly little tact. For through that transparent device the clergyman saw only too clearly what were the genuine motives.

'So you've not succeeded?' he returned. 'Well, I never supposed you would. Yorkshiremen are stubborn when once they take up an idea, Wakelin. I've remarked that before to-day, with a little laugh. And Wakelin changed the subject hastily.

'At any rate, you'll let me bring the carriage at three and give you a drive? Mitchell tells me as you ought to get a breath o' air.'

'Thanks; though I infinitely prefer my own room at present. How lazy this weakness makes one!'

It was whilst this interview was in progress up-stairs, that another and perhaps more important conversation was being carried on between two young people in the drawing-room, where Ena had been practising, and whither Dick, a strong, set purpose in his mind, had followed her.

'Have you realised that you'll be reduced to the sad necessity of missing me in another fortnight?' he remarked, with a smile, though his fingers were trembling as he abstracted from the music-rest a waltz of Chopin's that she had just finished, substituting the well-known and most beautiful of all Schubert's sonatas. 'Trinity Sunday is not far off. How shall I manage in my lonely rooms, Ena, after this taste of home-life?'

She shook her head, instead of speaking; it was easier at the moment.

'My sister Ena had always promised to come with me,' the young man continued persistently. 'But now'—

The pause was more eloquent than words. Nearly enough, Dick's ideas of love-making had improved of late.

Deep silence, broken only by the chords which Ena was drawing from the instrument in front of her. Dick watched her drooping face with a very eager, hopeful look in his bright eyes.

'Ena, I scarcely dare ask it. There is so much money between us, that people are sure to say hard things.'

'My money has never been anything but a bother yet,' exclaimed the young lady, with petulance. 'I used to think I should like to come into a fortune. But since I've had one, I've done nothing but hate it!'

'Oh! I wouldn't do that,' he declared. 'There are uses in money, as you'll find out by-and-by.' Then, with a sudden seizing of his chance, 'Let me teach you, Ena! Come and help me in my work amongst those who need some of it. Darling, if indeed you don't think that gold and silver need divide us, will you love me? Will you be my wife?'

But her head only sank the lower, and an expression almost of terror crept into Dick's yearning countenance.

'Oh Ena, and I want you so! You are all the world to me! Will you send me away when my whole heart belongs to you?'

She laughed very quietly then. 'Why didn't you say that first of all?' she answered.

Of course the news spread quickly through the vicarage; and Mildred wept a few tears of joy as she understood that the girl whom she had so long ago taken to her motherly heart was now to become her daughter indeed. Nor was there any effort made to confine the intelligence within four walls.

'Our wedding is not going to be put off for a dozen years or so; we shall be married very soon indeed,' asserted Dick, upon being questioned by Bijou. 'Oh yes, it's quite true, Ena, my dear. Else I shall be poisoned first and ruined afterwards by extravagant landladies. And then, what will you do?'

'Take Sir Marmaduke,' shrieked Bijou, with a backward nod at her brother, as she made a speedy exit before he could catch and punish her. 'Here's Mr Wakelin and the brougham for dad,' she added, returning after a moment to give the intelligence. 'Dick, he'll want your arm down-stairs; he always does.'

But the vicar was already descending, leaning upon the shoulder that he loved best in the world. When he reached the hall he looked down at his wife with a smile. 'How strong I'm getting, to be able to put up with your assistance, am I not, old lady? Now for my coat, Bijou; the thick one, please.'

She darted away to the coat-rack, where, however, the garment was not to be discovered, a fact which her shrill voice speedily proclaimed.

'It's in my wardrobe, then,' from her father. 'I was not wearing it for some time before I was ill. The last time that I had it on—when was it?'

Ena and Mr Wakelin exchanged glances, as the same remembrance recurred to the mind of each.

'Never since the morning that the money was lost,' the girl exclaimed, half aloud and half to the manufacturer. 'Here it is, though, now.'

'And jolly heavy too,' from its bearer. 'Mr Wakelin, as Dick is staring at Eua instead of helping me, you'd better take it.'

'It is heavy,' holding up the thick garment in his two hands to try the weight. 'Why, the pocket is full of something hard. May I empty it?' Then, suddenly, 'Mr Russell!'

At that startled exclamation all eyes turned upon him, whilst he withdrew his fist from the pocket into which he had thrust it. From between the fingers one or two gold coins escaped, and falling, rang loudly upon the tiled floor.

'The pupil teachers' salaries at last,' gasped Mildred, turning white. 'Oh, my dear Charlie!' And flinging herself upon his breast, she burst into tears. None but the wife herself could have told what to her had been the suffering of the past few weeks.

'And with the money that memorandum I brought of the amount. I'd forgotten it until this instant,' from Wakelin, as he flattened out a scrap of note-paper, bearing half-a-dozen figures. 'You must 'a' slipped it in here for safety, as you was called out to Brown's. On'y it's a wonder the clinking didn't remind you! Come, the folks may chatter now as much as they choose, any way. And if they ain't ashamed—why, they ought to be. I am, I know.'

But the vicar had sunk upon a chair and covered his face with his hands. 'You are right! That's exactly what I did. It all comes back to me now,' he murmured.

For a moment no other word was uttered. Then he lifted his face, and, looking around him, spoke the feeling of his heart. 'Thank God!' he said reverently. And Wakelin added, 'Amen!'

THE HIGHLAND BAGPIPE.

A SHORT time ago, a newspaper, in describing a march past of a Highland Volunteer brigade, stated that seventy-nine pipers formed the band, and played the men past. With the exception of Prince Charlie's hundred pipers an' a', an' a', this is probably the greatest number of men ever forming a band of pipers. It may be that the seventy-nine pipers was a printer's mistake on the part of the newspaper in question for 'Seventy-ninth' pipers—that is, the pipers from the Seventy-ninth Regiment.

Although Byron and Scott in stirring lines have told of the power of the mountain music, a very considerable number of the admirers of these two poets, while alive to the beauty of the language describing the 'Camerons' Gathering,' would scarcely care to concede any merit to the pipes save that of producing the most ear-piercing discord. It seems somehow the fate of men and things which call forth from many the most enthusiastic admiration, to be the butt of depreciation equally vigorous. The aversion which Englishmen have to the bagpipe is due chiefly to that prejudice, half affected, half real, which causes John Bull to deny the existence of any good thing north of the Tweed. In passing judg-

ment on the pipes, a very high standard is in vogue. The national instrument is supposed to possess a capability to accompany the drawing-room singer when the piano is out of tune, a task which it must be admitted is somewhat too onerous for an instrument especially adapted for military uses. Had the bugle or the drum been of Scotch origin, doubtless, they, too, would have been consigned to the category of things deserving a qualified opinion. It is not assuming too much to suppose that the English are sufficiently a music-loving race to have spared the violin such treatment if it had come from over the Border.

Though now associated with Scotland, the bagpipe is an instrument of great antiquity, and was known long ago to some Indian races, also to the Italians and Bretons. It appears to have reached its most popular development, from the musical and utilitarian view, in the case of the Highland bagpipe. The groundwork of the instrument is, as the name implies, a bag of skins sewn together, and of course perfectly air-tight. This condition is aided by the use of treacle, which is poured into the bag and allowed to soak well into it. Into the bag are fitted five wooden stocks, generally of crocus or ebony. These stocks in their turn hold the three drones, the chanter, and the mouth-piece—the chanter being perforated by the note-holes, while the mouth-piece is used for filling the bag. Each of the drone-pipes, and the chanter, is fitted with reeds made of Spanish cane, contrary to the general impression, which imagines the chanter to be a kind of flute, and the drones hollow sticks.

Bagpipe music has a fixed scale, and the treble or G clef is the only one used. The great difficulty of playing, however, is to obtain the doubling of the notes at once quickly and clearly. This profusion of doubled or grace notes, as they are called, makes the manuscript of bagpipe music look something like a document filched from the British Museum. Most players carry the drones on their left shoulder, but the right is sometimes used. In this case the player has to take the drones out and fix them so that the bass drone will rest on the right shoulder. If not, he must place his head between the drones, and support them by the connecting cord resting on the back of his neck, the small drones not being long enough to find support on the shoulder. To the Sassenach, such words as Taorluath, Taorlath Mach, Crunluath, Crunluath Breabach, look very ominous; but being interpreted, they are simply methods of doubling and trebling the notes. It can hardly be denied that the above terms, although they might be called jaw-breakers, look much more imposing than the Italian expressions which figure so largely in pianoforte practices.

It is not assuming too much to claim for Highland music that it has produced tunes more eminently fitted for marching than the music of any other nation. Most of us at some time or other have come across a Highland regiment on the march. Who does not know the roll of the distant drums, and mingling with it that prolonged drone, which gradually resolves itself into some old familiar tune, composed long ago to celebrate some bloody clan raid, such, for instance, as the Fìrèach of Donuil Dhu? To the

Scotsman, there is never any mistaking that sound; and though we may be nineteenth-century individuals with tall hats and black coats, we can't help going just a little way, and keeping step also. The pulse beats just a little quicker, and, despite all cheap sneers, the memory of a thousand years is a little more real than might have been expected. If an impartial observer should take such an occasion as this, he will notice that there is a swing and a go about a Highland regiment, quite peculiar to itself, and due in great measure to the music of the pipes. The swing of the sporrans and the waving of the kilts may add to the effect, and indeed such a sight would be difficult to beat; but watch the same body of men in tartan trews and white shell jackets, and you will see the same swing. It is not the easy gait of the jack-tar when under arms, nor the quick, sharp, precise step of an ordinary line regiment. It is a something born of the music, hard to account for, but nevertheless very apparent.

Another reason why the pipes get such scant sympathy is, that very often acquaintance with pipe-playing is brought about by that parody of the Celt, the Whitechapel Highlander. This gentleman perambulates the streets of many of our great towns in a guise which betrays evidence of having been procured at a cast-off clothing establishment. It is indeed a revelation to see one of these fellows in an old 93d Highlander's kilt with a Royal Stuart plaid and a tremendous belt, possessing a buckle about the size of a large dinner-plate. The sporran, too, is, to say the least, terrific; while, to complete this motley rag-shop, the worthy carries an old cavalry sword in place of a Highland claymore. The sword dance with which he favours his street audiences would do equally well for a hornpipe or an Irish jig. These good fellows hunt in couples, one to dance, and one to play. Occasionally they favour a crowd with a grand military march; but this by the way. The whole array is more than likely to be the property of some enterprising person, who rigs up a number of these men, after giving them a few lessons on the chanter, and sends them out to annoy decent people by their efforts to squeeze out—it can be called by no other name—the 'Barren Rocks of Aden' or the 'March of the Athole Men.' Their performances are always wound up by the Reel of Tulloch.

To hear men like M'Kay, the Prince of Wales's piper, or old John M'Kenzie, instructor to the London Scottish Volunteers, or some of the excellent performers who grace with their playing many of the summer Highland gatherings, is a discovery—nay, more, a startling eye-opener—for many who class pipe-playing with such elementary music as horn-blowing or comb-playing.

The pipes may not be the highest form of music; but many a time have they sounded very sweetly in the ears of the beleaguered and hard pressed. The fact of their being played at the relief of Lucknow has become a matter of historical controversy; but at the present time the relief of Ekowe is not sufficiently ancient for the presence of the pipes to be called into question. No doubt, many of us will live long enough to see the columns of the daily papers filled with letters to prove that no pipers ever marched into

Ekowe's fort playing 'The Campbells are coming.' The extension of the Volunteer movement has caused the bagpipes to play no inauspicious part in mimic war. What more popular, after a heavy field-day, in which our Volunteer forces have been engaged at Aldershot, or in the Easter manœuvres in the south of England, than the 'Elcho tartan' and swinging stride of the London Scottish; while their dozen or sixteen pipers, stationed opposite the saluting base, play them by to the tune of 'Hieland Laddie.' The Scottish have a reputation for marching second to none, and are the envy of many regiments not blest with pipers. It is, however, in the 'last scene of all,' when the son of the Gael is borne to his last resting-place, that the depth of feeling and sympathy with surroundings of the Highland music is most evident. Nothing seems to intensify and emphasise the desolation and the separation of death more than the sad wailing notes of 'Lord Lovat's Lament,' or 'Lochaber no more.'

THE MONTH:

SCIENCE AND ARTS.

ARCTIC exploration is once more attracting so much attention, that any fresh information concerning the north polar regions is apt to excite interest. A vessel recently returned to San Francisco, after carrying supplies to the whalers north of Alaska, has reported that one of the fleet found open water at the mouth of the Mackenzie River, and that its master was daring enough to follow it until a more northerly point was reached than that attained by the Greely expedition. Such open water is not unknown in this neighbourhood, but it occurs only once in about ten years. Whalers regard it as a most dangerous thing to take advantage of this open water, for there is always a fear that the ice may close in behind them and prevent their return. One whaling master some years ago took the risk, and proceeded northward for about three hundred miles, but no whales rewarded his intrepidity. He saw land-birds, and met with a considerable amount of driftwood, which led him to believe that land was not far distant.

An extraordinary accident, the first of its kind, occurred recently at Bradford. A boy was carrying a steel cylinder of compressed oxygen, when it suddenly burst with tremendous violence and killed the unfortunate lad. This terrible occurrence is a matter of very great importance to a large number of workers, for compressed gases of different kinds are now used in a number of industries, and thousands of these steel cylinders are in daily use. The cause of the accident is attributed by experts to be due to faulty material in the construction of this particular cylinder. As a rule, the most rigid tests are employed in ascertaining the stability of these gas receptacles before they are issued to the public; and some years ago experiments at Glasgow showed that it was impossible to rupture one by the most violent treatment. In one experiment, a fully charged

cylinder was dropped repeatedly upon an iron block from a height of twenty feet, and in another it was submitted to blows from a steam-hammer without any adverse effect but a few dents on its surface. In view of the accident at Bradford it will become necessary that every gas cylinder shall have some kind of official mark, showing that it has been tested to a great deal more than the pressure it is called upon to withstand.

All lovers of nature will feel glad that an attempt is being made to prevent rural districts being spoilt by obtrusive advertisements. A Bill is now before Parliament the preamble of which states that 'it is expedient to prohibit the raising of unsightly erections which destroy the rural scenery of Great Britain and Ireland.' This Bill provides that no person shall affix to any fence, gate, post, hoarding, &c., any printed or written matter, or any picture, so as to be in view from any highway, railway, &c. The Act will not interfere with what may be called legitimate advertising—that is to say, a board may be erected on land showing that it is to let or for sale; or any person carrying on a business may advertise that business on the land occupied by him. It is aimed solely at that system of advertising which has sprung up quite recently by which pleasant meadows are rendered unsightly by the presence in their midst of huge hoardings advertising food-stuffs, soaps, and patent medicines. It is not only the general public which requires protection against such advertising, but the advertisers themselves, for the advertisements are not always in the best taste.

An ingenious form of boat to be driven by hydraulic propulsion has been designed and patented by Mr J. C. Walker of Washington. Many such boats have been devised, and at the present time certain floating fire-engines are propelled in the Thames by this method. But Mr Walker's design differs very much from those which have preceded it. There are two main pipes extending from bow to stern open to the water, and within them are screw propellers, each having a rim fixed to the outer edges of its blades, so as to fit closely into its containing pipe. These main pipes gradually taper towards the stern, and from them proceed smaller pipes furnished with nozzles, which find their exits at the sides of the vessel. The action of the propellers is to force the water with great velocity through this system of piping, and steering and turning are rapidly effected by turning the nozzles in any direction required. In case of stranding, all the nozzles would be directed downwards, so that the boat would be lifted while the bottom was scoured at the same time. The design seems to us to be hopeful, and we should be glad to learn the results of actual trial of the system.

Mr John Briggs of Clitheroe, Lancashire, has forwarded to us a plan and description of his patent Lime-kiln, by which, he asserts, a saving of from thirty-five to forty per cent. in fuel is secured when compared with the older system of burning lime. Existing kilns can be altered to the new pattern without much expense or difficulty, securing not only saving in fuel, but superior quality of the lime produced, a greater output per kiln, and less refuse. The principal

feature of the patent kiln is a drying chamber above the calcining chamber, in which the waste heat thoroughly dries and partially burns the limestone. The high price of fuel during recent years suggested experiments which led to the invention of this kiln.

Another instance of necessity stimulating invention is seen in the wonderful improvements which have been introduced in the manner of using gas for both heating and cooking. The recent coal-strike has had one good effect in teaching the value of gas for both these purposes, and many persons who have adopted it will not readily go back to the mess and trouble of coal-fires. Gas is economical when compared with coal, provided that it is only burned when actually needed: it must not be left to the tender mercies of careless and irresponsible servants. Gas heating and cooking will become general when the gas companies, or some other companies, provide us with a cheap non-illuminating gas for these purposes. Such a gas, it is said, could be retailed for about a shilling per thousand feet.

While there is a constant cry for more open spaces in our crowded metropolis, and while certain societies and individuals are doing their best to provide these 'lungs' for pent-up London, the builder, on the other hand, is seizing upon every rood of open land which he can find to cover it with loosely combined bricks and mortar. Within the past thirty-five years, Vauxhall, Cremorne, and the Surrey Gardens have disappeared, and although in some respects this need not be deplored, it seems a sad thing that they could not be preserved as parks. A garden of another kind is now threatened with extinction, a garden whose chronicles embrace the history of botany in this country—the old Physic Garden at Chelsea. This garden was bestowed upon the Apothecaries' Company by Sir Hans Sloane in 1721, on the express condition that 'it should at all times be continued as a Physic Garden for the manifestation of the power and wisdom and goodness of God in creation, and that the apprentices might learn to distinguish good and useful plants from beautiful ones.' The temptation of the Apothecaries' Company to set this condition at naught is found in the circumstance that the cost of maintaining the garden is seven hundred pounds per annum, and the value of the freehold for building is thirty thousand pounds. We trust that this link with the past will not be severed without some effort being made to save it.

The twelfth course of Health Lectures was recently inaugurated in Edinburgh by Professor M'Fadyean, of the Royal Veterinary College in London, who took for his subject one with which he was peculiarly qualified to deal—namely, 'Diseases of Animals transmissible to Man.' He cautioned his hearers against dogs and cats with mangy or unhealthy-looking skins. Ring-worm, in one form or other, was found in the cat, in young cattle, and in the horse, and was readily transmissible to man. Glanders was one of the most important diseases common to men and animals, and its breeding-place for Scotland was Glasgow, just as London acted in the same capacity for England. He thought that if a little more energy were displayed by the local authorities in Lanarkshire in dealing with the

disease it would soon be stamped out. Finally, the lecturer spoke of hydrophobia, which by reason of its deadly nature and distressingly painful course was the most terrible malady of all that man could contract from one of the lower animals. But thanks to the magnificent researches of Pasteur, the fatal cases when treated by the inoculation method had sunk to less than one per cent.

It has been pointed out by Mr John Wallace, a well-known fish-shipper at Kalama, Washington, that fish when frozen solid for shipment will remain in that condition for several days, provided that they are packed in a particular manner—without ice. A large trade is now done in frozen salmon, and the fish are packed tightly in boxes and loaded into refrigerator cars. The cars are first of all reduced in temperature as low as possible, and the floors are then covered with chilled sawdust. The boxes of fish are then placed therein, any spaces between them being filled with the cold sawdust. The car is then closed and sealed, and in reasonably warm weather its contents may be relied upon to arrive at their destination in the most perfect condition after a passage of eighteen days or thereabouts. The saving effected is great, first on the original cost of the ice; secondly, on its freight; and thirdly, in the greater amount of fish which it is possible to carry in its stead.

An interesting experiment has been performed by Mons. H. Le Chatelier, which, although at present of no commercial importance, shows how it is possible to imitate one of nature's processes—namely, the conversion of lime into marble. Carbonate of lime is commonly rendered crystalline and changed into what we call marble by pressure in nature's laboratory and by the aid of volcanic heat. Mons. Chatelier imitates this process by submitting powdered lime to great pressure in a steel cylinder, and conveying heat to it by means of a platinum spiral carrying an electric current. It is found that the powder in the neighbourhood of the hot wire is rendered crystalline and translucent. It might be possible by the employment of heavy machinery to do on a large scale what has been accomplished successfully in an experimental manner, but the cost of the plant would be great, and the expense would hardly be justified when the outcome is so uncertain.

It is said that a circular saw has been invented in France, by the aid of which blocks of stone can be very rapidly cut. The edge of the saw is set with black diamonds, of the kind which are now so successfully employed for drilling through hard rock. But the idea is not new, for a similar saw was patented some years back in America. Indeed, it will be seen that such a saw is the natural outcome of the diamond drill to which we have referred, and the diamond drill is now many years old.

The *Engineer* exposes a cruel fraud to which, in the interest of our numerous readers of an inventive turn of mind, we give publication. Some swindlers are in the habit of looking over the Patent Office publications and learning therefrom that certain persons have taken out letters-patent. They then write to these patentees somewhat to this effect: 'We see that you have patented a good thing. We are acquainted with

a firm which will place it on the market for you, and find capital for its successful introduction, advertising, &c. Please send a cheque for — pounds to cover cost of negotiations.' We need hardly point out to the wary that this letter is written solely in order to secure this cheque. Inventors are frequently needy men, and it is well that they should be warned of these doings.

The 'Safe-boiling' Stove Mat is a device which has just been introduced by Messrs Benham & Froud of the Chandos Metal Works, London. It consists of a round mat of asbestos enclosed in a metal frame, which being placed under a boiling saucepan on a stove prevents its contents burning. Oatmeal, rice, milk, custards, &c. placed above this mat will need no stirring, neither will they burn. When the mat becomes soiled it is merely necessary to turn its blackened surface next the fire, when it will burn itself clean.

Photogravure has killed steel-engraving, and the photo-mechanical process block has done much to kill wood-engraving. But Mr Walter Crane, who knows what he is writing about, believes that there are signs that wood-engraving will once more revive 'after holding its own as the great popular interpreter of art since the invention of printing; and, with the revival of printing as an art, the craft of the wood-engraver, contributing as it has done, in association with vigorous design, to the beauty of books, cannot permanently suffer neglect.' Unfortunately for Mr Crane's contention, there are few really good wood-engravers now, and fresh workers are not likely to be attracted to what seems to be a declining industry. Artists are now learning how to obtain the best effects from process-work, and most would prefer to have their ideas interpreted by the rigidly correct camera than by an indifferent wood-engraver.

A new system of heating railway carriages has recently been put into practice on the Midland Railway, pipes conveying steam from the engine running right round each carriage, and thus dispensing with the unsatisfactory and clumsy foot-warmer. The system will, when adopted entirely, it is said, effect a very great saving. The only matter for surprise is that such an obviously convenient method of warming railway carriages—which has been suggested in these columns and elsewhere on more than one occasion—has not been adopted before.

Some improvements have lately been introduced in the incandescent gaslight system which are worthy of remark. The refractory mantle, which, by becoming white-hot in an atmospheric flame, gives out so much more light per cubic foot of gas burnt than any other form of burner known, is now supported on a central stem, which itself becomes white-hot, and thus adds to the general illuminating power. Formerly, the mantle was hung to a side-support of metal, and this gave rise to breakage of both mantle and glass chimney. The chimney is now made of mica, and is therefore quite unbreakable under any conditions whatever. The efficiency of the light is in other ways improved.

A curious freak of nature is reported to our contemporary *Nature* by Colonel A. T. Fraser, with regard to two Hindu dwarfs which he

photographed in the Karnoul district of the Madras Presidency. One of these dwarfs states that he belongs to a family all the male members of which have been dwarfs for many generations. They marry ordinary native girls, and their female children are of normal size; but the boys, when about six years of age, cease to grow, and become stunted specimens of humanity, who are almost helpless and can only walk a few yards.

The tremendous power of the sword-fish has often been evidenced by a ship's side being pierced with the terrible weapon which gives the creature its name. Four or five inches of solid timber have been thus penetrated, the sword being broken off and left in the wood. These fish are plentiful off the island of Martha's Vineyard, on the coast of Massachusetts, and its flesh being much valued, it is harpooned in great numbers; and many are the stories told of narrow escapes encountered by its captors through its pugnacity. One of them deals with an experience met with last summer, when a man in a small boat proceeded from a fishing smack to secure a wounded fish which was motionless and apparently exhausted. But no sooner was the harpoon line moved, than the fish made a struggle for life, and after diving once, with the object of spearing the boat, and missing his aim, the fish dived a second time, and succeeded in driving his sword completely through the boat from side to side. By constant baling, the boat was kept afloat until assistance arrived, when it was found that the intruder weighed three hundred and thirty-eight pounds. The incident is described and illustrated in a recent issue of the *Scientific American*.

A CURIOUS TRADE.

IN a small village in the south of England, 'Jimmy Greg' carries on his business of naturalist and taxidermist. The old man is a well-known personage for miles around, and may often be seen, with his sugaring can and collecting implements, making his way to the adjacent woods in search of specimens. One afternoon the writer called at his little shop to interview him. After inspecting numerous cases of butterflies, moths, and birds' eggs, we adjourned to his cosy sitting-room, where Jimmy gave me a full account of his work.

I always had a liking for natural history (said the old man), and when quite a boy, had the finest collection of birds' eggs in the district. For over twenty years I have been in my present line, and have increased my trade until now I clear about one hundred and twenty pounds a year—quite a large income in this part of the country. Collecting insects pays me best. I have regular customers and send cases of specimens to all parts of England.

Most of the nocturnal moths are caught by sugaring. About dusk I turn out with a tin containing a mixture of brown sugar and rum; with a brush I daub the trunks of trees in the clearings of the woods. I visit the trees several times during the night and collect a great number of moths; the rum stupefies them, and they are easily captured. Most of the moths taken

at sugar are of the commoner kinds, but there is always a sprinkling of better insects. Good or bad, I have no difficulty in disposing of them.

You would be surprised at the number of amateurs who buy direct from me. One old gentleman who has done business with me over fifteen years must have a splendid collection of birds' skins; I have sent him ten pounds' worth at once several times.

The different hawk-moths sell from threepence to two shillings each, the latter price being for the peculiar Death's-head moth. Any damaged females I capture are boxed off, and in the course of a few days they will generally lay a few hundred eggs; these I advertise in the entomological papers, and send to purchasers by post packed in quills.

Caterpillars I have very little sale for; but the scarcer kinds I feed up until they turn to pupæ, for which there is always a great demand, as they need very little attention, and when the moth emerges, it is in faultless condition. I have a greenhouse in my back garden, in which I grow nettles, grasses, and weeds of all kinds; any uncommon caterpillar I meet with is put in there, and generally finds some kind of plant to feed on. The ground is occasionally watered; beyond that, everything is left to nature. On reaching maturity, the larva buries itself in the soil for its change into the pupa state; and after its long winter's sleep, emerges from its case as a winged insect. Sometimes on a bright spring morning I may find eighty or ninety moths have made their appearance since the previous evening; this will be repeated any after day for some weeks. I generally kill the moths by dropping benzine on them from a medicine dropper. There are several other ways; but this is as convenient as any. The specimens are then pinned on a cork setting-board, grooved down the centre to admit the body of the moth; the wings are put in position and fastened down by strips of thin cardboard, which are removed after the insect has dried and set.

An amusing incident occurred some years ago. I was rearing some larvæ of a scarce moth, and attended to them daily. One morning an eruption broke out on my neck; the irritation became so painful that I had to consult a doctor. He said I was suffering from a very uncommon skin disease, and called in his assistant to look at it. After lecturing on it and calling it by a Latin name, he gave me a lotion that burned like hot cinders. The inflammation grew worse, until one day a customer of mine, a well-known entomologist, called to see me. When I told him what the doctor had said, he laughed until I thought he would have had a fit. 'Why,' he remarked, 'it's only urtication. I have known plenty of similar cases. The hairs on some caterpillars come off very often, and if they get on the face or neck, cause great irritation. Throw the lotion into the fire; take a few doses of citrate of magnesia, and you'll be all right in a few days.'

There is one strange method of catching moths that I have not yet mentioned. If you rear a female Kentish-glory or Emperor moth, and take her into the fields in a gauze cage, she will attract any males of the same species that may be in the neighbourhood. They will crawl round the prison of their charmer with fluttering wings,

and may be easily captured. Light, also, has a great fascination for moths. Many naturalists on the outskirts of towns visit the street lamps regularly to net the insects that settle on the glasses.

We sat smoking and talking more than an hour; and when I left the old man my knowledge of insect-collecting was greatly increased.

F A R A W A Y.

Do they think of me to-day,
By the Christmas fire's warm glow,
In the old home far away,
Where they loved me long ago?
When they note my vacant chair,
Do they pause amidst their glee
To breathe a tender prayer,
Or a kindly wish for me?

Through the glistening winter rime,
From the church across the stream,
Do they listen to the chime
That I hear but in a dream?

While the beads like rubies show
On the frosted holly spray,
And the paths are white with snow
Round the old home far away!

In this sunny foreign land,
Where no Christmas berries shine,
How I wish that each dear hand
Could be fondly clasped in mine!
Ah, the mellow firelight falls,
And the restless shadows play,
On the holly brightened walls
Of the old home far away!

But they think of me, I know;
They still hold my memory dear;
By the Yule log's cheery glow
They will sometimes wish me near;
And my tears unbidden fall
As in broken tones I pray
That God may bless them all
In the old home far away!

E. MATHESON.

'Volume X. of the Fifth Series of CHAMBERS'S JOURNAL is now completed, price Nine Shillings. A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller. A cloth case for binding the whole of the numbers for 1893 is also ready. Back numbers to complete sets may be had at all times.'

A NEW NOVEL

A T M A R K E T V A L U E

BY

GRANT ALLEN

AUTHOR OF 'THIS MORTAL COIL,' 'BLOOD ROYAL,' 'THE SCALLYWAG,' ETC.

will be commenced in the Part of CHAMBERS'S JOURNAL published at the end of January,
which will also contain a complete Story in Four Chapters, entitled

THE GIRL FROM MADEIRA

By P. L. McDERMOTT

Author of 'Julius Vernon,' 'The Last King of Yewle,' etc.

END OF THE TENTH VOLUME
